- **HIGH DENSITY PROGRAMMABLE LOGIC**
 - 6000 PLD Gates
 - 64 I/O Pins, Eight Dedicated Inputs
 - 192 Registers
 - High Speed Global Interconnect
 - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
 - Small Logic Block Size for Random Logic
- **HIGH PERFORMANCE E²CMOS® TECHNOLOGY**
 - $f_{max} = 125$ MHz Maximum Operating Frequency
 - $t_{pd} = 7.5$ ns Propagation Delay
 - TTL Compatible Inputs and Outputs
 - Electrically Erasable and Reprogrammable
 - Non-Volatile
 - 100% Tested at Time of Manufacture
 - Unused Product Term Shutdown Saves Power
- **ispLSI OFFERS THE FOLLOWING ADDED FEATURES**
 - In-System Programmable (ISP™) 5-Volt Only
 - Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
 - Reprogram Soldered Devices for Faster Prototyping
- **OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
 - Complete Programmable Device Can Combine Glue Logic and Structured Designs
 - Enhanced Pin Locking Capability
 - Four Dedicated Clock Input Pins
 - Synchronous and Asynchronous Clocks
 - Programmable Output Slew Rate Control to Minimize Switching Noise
 - Flexible Pin Placement
 - Optimized Global Routing Pool Provides Global Interconnectivity
- **ispEXPERT™ – LOGIC COMPILER AND COMPLETE ISP DEVICE DESIGN SYSTEMS FROM HDL SYNTHESIS THROUGH IN-SYSTEM PROGRAMMING**
 - Superior Quality of Results
 - Tightly Integrated with Leading CAE Vendor Tools
 - Productivity Enhancing Timing Analyzer, Explore Tools, Timing Simulator and ispANALYZER™

Description

The ispLSI and pLSI 1032E are High Density Programmable Logic Devices containing 192 Registers, 64 Universal I/O pins, eight Dedicated Input pins, four Dedicated Clock Input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 1032E features 5-Volt in-system programmability and in-system diagnostic capabilities. The ispLSI 1032E device offers non-volatile reprogrammability of the logic, as well as the interconnects to provide truly reconfigurable systems. It is architecturally and parametrically compatible to the pLSI 1032E device, but multiplexes four input pins to control in-system programming. A functional superset of the ispLSI and pLSI 1032 architecture, the ispLSI and pLSI 1032E devices add two new global output enable pins.

The basic unit of logic on the ispLSI and pLSI 1032E devices is the Generic Logic Block (GLB). The GLBs are labeled A0, A1...D7 (see Figure 1). There are a total of 32 GLBs in the ispLSI and pLSI 1032E devices. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

Functional Block Diagram

Figure 1. *ispLSI* and *pLSI* 1032E Functional Block Diagram

*ISP Control Functions for *ispLSI* 1032E Only

The devices also have 64 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, registered input, latched input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise.

Eight GLBs, 16 I/O cells, two dedicated inputs and one ORP are connected together to make a Megablock (see figure 1). The outputs of the eight GLBs are connected to a set of 16 universal I/O cells by the ORP. Each *ispLSI* and *pLSI* 1032E device contains four Megablocks.

The GRP has, as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the *ispLSI* and *pLSI* 1032E devices are selected using the Clock Distribution Network. Four dedicated clock pins (Y0, Y1, Y2 and Y3) are brought into the distribution network, and five clock outputs (CLK 0, CLK 1, CLK 2, IOCLK 0 and IOCLK 1) are provided to route clocks to the GLBs and I/O cells. The Clock Distribution Network can also be driven from a special clock GLB (C0 on the *ispLSI* and *pLSI* 1032E devices). The logic of this GLB allows the user to create an internal clock from a combination of internal signals within the device.

Absolute Maximum Ratings 1

Supply Voltage V_{CC} -0.5 to +7.0V
 Input Voltage Applied -2.5 to V_{CC} +1.0V
 Off-State Output Voltage Applied -2.5 to V_{CC} +1.0V
 Storage Temperature -65 to 150°C
 Case Temp. with Power Applied -55 to 125°C
 Max. Junction Temp. (T_J) with Power Applied ... 150°C

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

- One output at a time for a maximum duration of one second. $V_{OUT}= 0.5V$ was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.
- Measured using eight 16-bit counters.
- Typical values are at $V_{CC}= 5V$ and $T_A= 25^\circ C$.
- Maximum I_{CC} varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM to estimate maximum I_{CC} .

Power Consumption

Power consumption in the ispLSI and pLSI 1032E device depends on two primary factors: the speed at which the device is operating, and the number of product terms

used. Figure 3 shows the relationship between power and operating speed.

Figure 3. Typical Device Power Consumption vs fmax

Notes: Configuration of eight 16-bit counters
 Typical current at 5V, 25°C

I_{CC} can be estimated for the ispLSI and pLSI 1032E using the following equation:

$$I_{CC}(\text{mA}) = 15 + (\# \text{ of PTs} * 0.59) + (\# \text{ of nets} * \text{Max freq} * 0.0078)$$

Where:

of PTs = Number of Product Terms used in design

of nets = Number of Signals used in device

Max freq = Highest Clock Frequency to the device (in MHz)

The I_{CC} estimate is based on typical conditions ($V_{CC} = 5.0\text{V}$, room temperature) and an assumption of four GLB loads on average exists. These values are for estimates only. Since the value of I_{CC} is sensitive to operating conditions and the program in the device, the actual I_{CC} should be verified.

GOE 0/IN 4 ³	67	66	This is a dual function pin. It can be used either as Global Output Enable for all I/O cells or it can be used as a dedicated input pin.
GOE 1/IN 5 ³	84	87	This is a dual function pin. It can be used either as Global Output Enable for all I/O cells or it can be used as a dedicated input pin.
IN 6, IN 7	2, 19	89, 10	Dedicated input pins to the device.
ispEN/NC ^{1,2}	23	14	Input - Dedicated in-system programming enable input pin. This pin is brought low to enable the programming mode. The MODE, SDI, SDO and SCLK options become active.
SDI/IN 0 ²	25	16	Input - This pin performs two functions. When <u>ispEN</u> is logic low, it functions as an input pin to load programming data into the device. SDI/IN 0 is also used as one of the two control pins for the isp state machine. It is a dedicated input pin when <u>ispEN</u> is logic high.
MODE/IN 1 ²	42	37	Input - This pin performs two functions. When <u>ispEN</u> is logic low, it functions as pin to control the operation of the isp state machine. It is a dedicated input pin when <u>ispEN</u> is logic high.
SDO/IN 2 ²	44	39	Output/Input - This pin performs two functions. When <u>ispEN</u> is logic low, it functions as an output pin to read serial shift register data. It is a dedicated input pin when <u>ispEN</u> is logic high.
SCLK/IN 3 ²	61	60	Input - This pin performs two functions. When <u>ispEN</u> is logic low, it functions as a clock pin for the Serial Shift Register. It is a dedicated input pin when <u>ispEN</u> is logic high.
RESET	24	15	Active Low (0) Reset pin which resets all of the GLB and I/O registers in the device.
Y0	20	11	Dedicated Clock input. This clock input is connected to one of the clock inputs of all of the GLBs on the device.
Y1	66	65	Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any GLB on the device.
Y2	63	62	Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any GLB and/or any I/O cell on the device.
Y3	62	61	Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any I/O cell on the device.
GND	1, 22, 43, 64	13, 38, 63, 88	Ground (GND)
VCC	21, 65	12, 64	Vcc
NC ¹		1, 2, 24, 25, 26, 27, 49, 50, 51, 52, 74, 75, 76, 77, 99, 100	No connect.

1. NC pins are not to be connected to any ative signals, Vcc or GND.

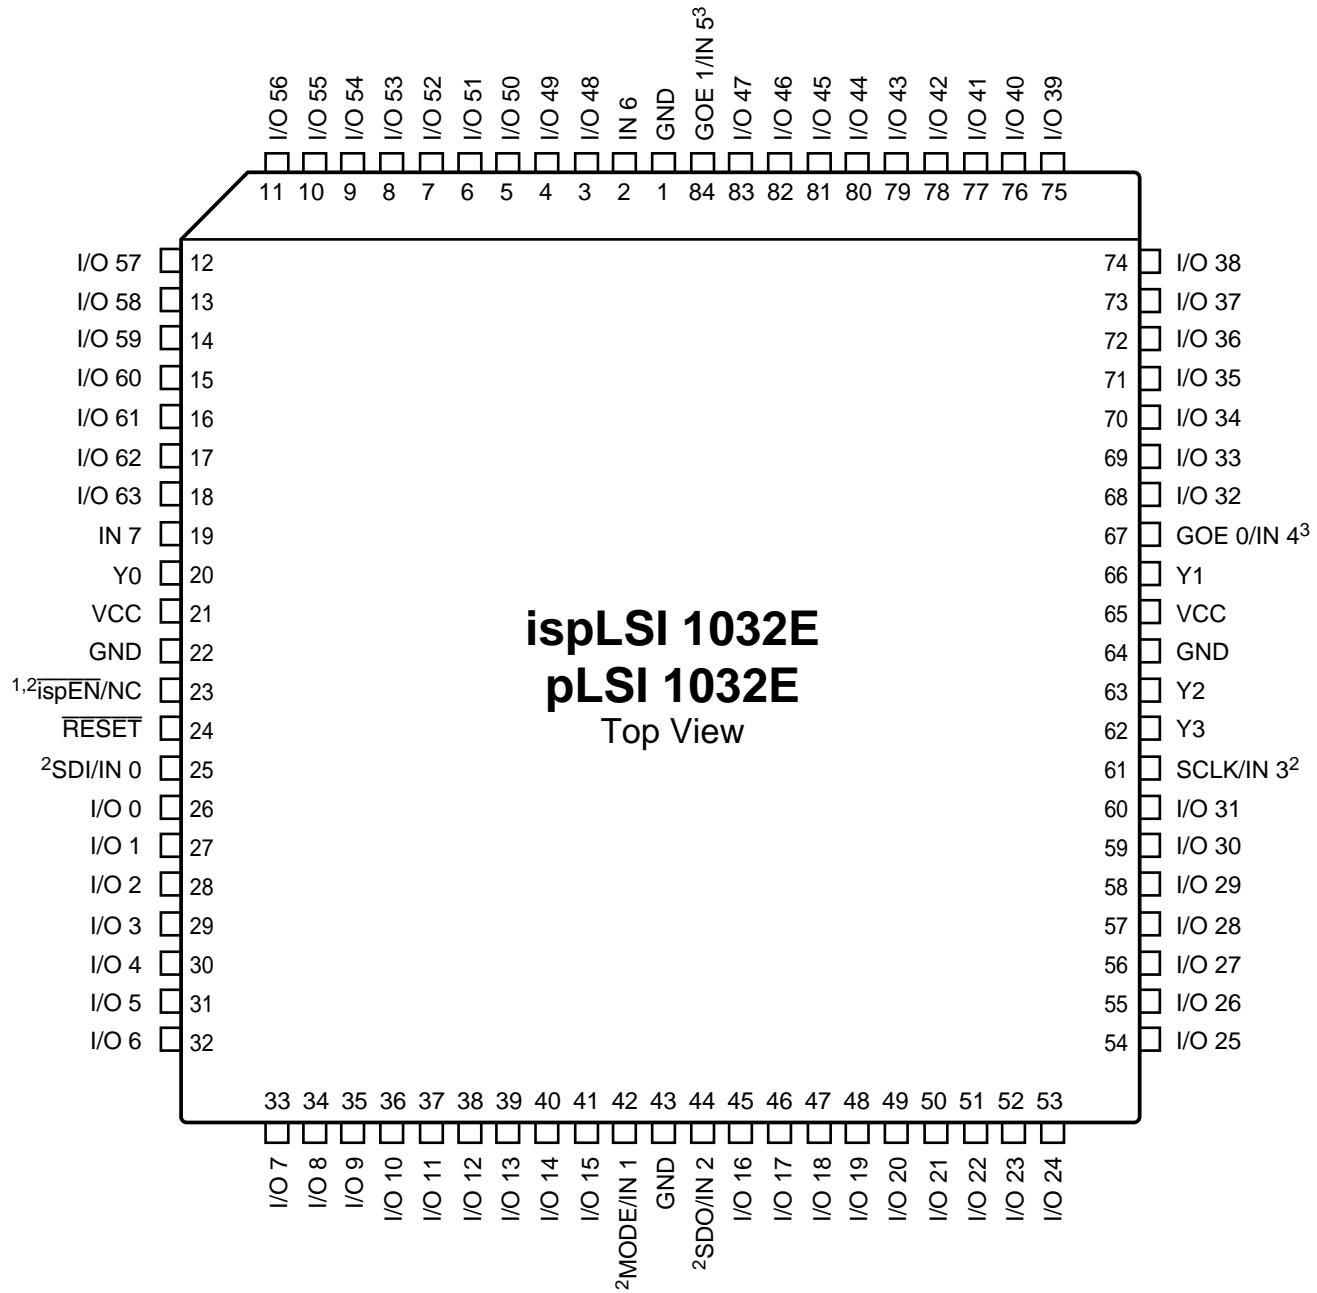

2. Pins have dual function capability for *ispLSI* 1032E only.

3. Pins have dual function capability which is software selectable.
