

## Advance Information

### LIN Enhanced Physical Interface

Local Interconnect Network (LIN) is a serial communication protocol designed to support automotive networks in conjunction with Controller Area Network (CAN). As the lowest level of a hierarchical network, LIN enables cost-effective communication with sensors and actuators when all the features of CAN are not required.

The 33661 is a Physical Layer component dedicated to automotive LIN sub-bus applications. It offers slew rate selection for optimized operation at 10 kbps and 20 kbps, fast baud rate (above 100 kbps) for test and programming modes, excellent radiated emission performance, and safe behavior in the event of LIN bus short-to-ground or LIN bus leakage during low-power mode.

#### Features

- Operational from  $V_{SUP}$  6.0 V to 18 V DC, Functional up to 27 V DC, and Handles 40 V During Load Dump
- Active Bus Waveshaping Offering Excellent Radiated Emission Performance
- 5.0 kV ESD on LIN Bus Terminal
- 30 k $\Omega$  Internal Pullup Resistor
- LIN Bus Short-to-Ground or High Leakage in Sleep Mode
- 18 V to +40 V DC Voltage at LIN Terminal
- 8.0  $\mu$ A Standby Current in Sleep Mode
- Local and Remote Wake-Up Capability Reported by INH and RXD Terminals
- 5.0 V and 3.3 V Compatible Digital Inputs Without Any External Components Required

## TERMINAL DEFINITIONS

A functional description of each terminal can be found in the System/Application Information section beginning on [page 13](#).

Terminal	Terminal Name	Formal Name	Definition
1	RXD	Receiver Output	MCU interface that reports the state of the LIN bus voltage.
2	EN	Enable Control	Controls the operation mode of the interface.
3	WAKE	Wake Input	A high-voltage input used to wake up the device from sleep mode.
4	TXD	Transmitter Input	MCU interface to control the state of the LIN output.
5	INH	Inhibit Output	This terminal can have two main functions: controlling an external switchable voltage regulator or driving a bus external resistor in the master node application.
6	V <sub>SUP</sub>	Power Supply	Device power supply terminal.
7	LIN	LIN Bus	Represents the single-wire bus transmitter and receiver.
8	GND	Ground	Device ground terminal.

## MAXIMUM RATINGS

All voltages are with respect to ground unless otherwise noted. Exceeding these ratings may cause a malfunction or permanent damage to the device.

Ratings	Symbol	Value	Unit
---------	--------	-------	------

### ELECTRICAL RATINGS

Power Supply Voltage Continuous Supply Voltage Transient Voltage (Load Dump)	$V_{SUP}$	27 40	V
WAKE DC and Transient Voltage (Through a 33 k $\Omega$ Serial Resistor)	$V_{WAKE}$	-18 to 40	V
Logic Terminals (RXD, TXD, EN)	$V_{LOG}$	-0.3 to 5.5	V
LIN DC Voltage Transient (Coupled Through 1.0 nF Capacitor)	$V_{BUS}$	-18 to 40 -150 to 100	V
INH DC Voltage DC Current	$V_{INH}$ $I_{INH}$	-0.3 to $V_{SUP} + 0.3$ 40	V mA
ESD Human Body Model (Note 1) All Terminals LIN Terminal with Respect to Ground	$V_{ESD1}$	$\pm 2000$ $\pm 5000$	V
ESD Machine Model (Note 2) All Terminals	$V_{ESD2}$	$\pm 200$	V

### THERMAL RATINGS

Operating Temperature Ambient Junction	$T_A$ $T_J$	-40 to 125 -40 to 150	$^{\circ}\text{C}$
Storage Temperature	$T_S$	-40 to 150	$^{\circ}\text{C}$
Thermal Resistance Junction to Ambient	$R_{\theta JA}$	150	$^{\circ}\text{C}/\text{W}$
Peak Package Reflow Temperature During Solder Mounting (Note 3)	$T_{SOLDER}$	240	$^{\circ}\text{C}$
Thermal Shutdown	$T_{SHUT}$	150 to 200	$^{\circ}\text{C}$
Thermal Shutdown Hysteresis	$T_{HYST}$	8.0 to 20	$^{\circ}\text{C}$

#### Notes

- ESD1 testing is performed in accordance with the Human Body Model ( $C_{ZAP} = 100 \text{ pF}$ ,  $R_{ZAP} = 1500 \Omega$ ).
- ESD2 testing is performed in accordance with the Machine Model ( $C_{ZAP} = 220 \text{ pF}$ ,  $R_{ZAP} = 0 \Omega$ ).
- Terminal soldering temperature limit is for 10 seconds maximum duration. Not designed for immersion soldering. Exceeding these limits may cause malfunction or permanent damage to the device.

## STATIC ELECTRICAL CHARACTERISTICS

Characteristics noted under conditions  $7.0\text{ V} \leq V_{\text{SUP}} \leq 18\text{ V}$ ,  $-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$ ,  $\text{GND} = 0\text{ V}$  unless otherwise noted. Typical values noted reflect the approximate parameter means at  $T_A = 25^\circ\text{C}$  under nominal conditions unless otherwise noted.

Characteristic	Symbol	Min	Typ	Max	Unit
----------------	--------	-----	-----	-----	------

### $V_{\text{SUP}}$ TERMINAL (DEVICE POWER SUPPLY)

Nominal DC Voltage	$V_{\text{SUP}}$	7.0	13.5	18.0	V
Functional DC Voltage $T_A \geq 25^\circ\text{C}$	$V_{\text{SUP}}$	6.0	–	–	V
Supply Current in Sleep Mode $V_{\text{SUP}} \leq 13.5\text{ V}$ , Bus Recessive	$I_{\text{S1}}$	–	8.0	12	$\mu\text{A}$
$13.5\text{ V} < V_{\text{SUP}} < 18\text{ V}$	$I_{\text{S2}}$	–	–	200	
$V_{\text{SUP}} \leq 13.5\text{ V}$ , Bus Dominant or Shorted to GND	$I_{\text{S3}}$	–	300	–	
Supply Current in Normal, Slow or Fast Mode Bus Recessive, Excluding INH Output Current	$I_{\text{S(N-REC)}}$	–	4.0	6.0	$\text{mA}$
Bus Dominant, Total Bus Load $> 500\ \Omega$ , Excluding INH Output Current	$I_{\text{S(N-DOM)}}$	–	6.0	8.0	

### RXD OUTPUT TERMINAL (LOGIC)

Low-Level Voltage Output $I_{\text{IN}} \leq 1.5\text{ mA}$	$V_{\text{OL}}$	0	–	0.9	V
High-Level Voltage Output $V_{\text{EN}} = 5.0\text{ V}$ , $I_{\text{OUT}} \leq 250\ \mu\text{A}$	$V_{\text{OH}}$	4.25	–	5.25	V
$V_{\text{EN}} = 3.3\text{ V}$ , $I_{\text{OUT}} \leq 250\ \mu\text{A}$		3.0	–	3.5	

### TXD INPUT TERMINAL (LOGIC)

Low-Level Voltage Input	$V_{\text{IL}}$	–	–	1.2	V
High-Level Voltage Input	$V_{\text{IH}}$	2.5	–	–	V
Input Threshold Hysteresis	$V_{\text{INHYST}}$	100	300	800	mV
Pullup Current Source $V_{\text{EN}} = 5.0\text{ V}$ , $1.0\text{ V} < V_{\text{TXD}} < 3.5\text{ V}$	$I_{\text{S1}}$	-60	-35	-20	$\mu\text{A}$

### ENABLE INPUT TERMINAL (LOGIC)

Low-Level Voltage Input	$V_{\text{IL}}$	–	–	1.2	V
High-Level Voltage Input	$V_{\text{IH}}$	2.5	–	–	V
Input Threshold Hysteresis	$V_{\text{INHYST}}$	100	300	800	mV
Low-Level Input Current $V_{\text{IN}} = 1.0\text{ V}$	$I_{\text{IL}}$	5.0	20	30	$\mu\text{A}$
High-Level Input Current $V_{\text{IN}} = 4.0\text{ V}$	$I_{\text{IH}}$	–	20	40	$\mu\text{A}$

### LIN BUS TERMINAL (VOLTAGE EXPRESSED VERSUS $V_{\text{SUP}}$ VOLTAGE)

Low-Level Dominant Voltage External Bus Pullup $500\ \Omega$	$V_{\text{LINlow}}$	–	–	1.4	V
High-Level Voltage TXD High, $I_{\text{OUT}} = 1.0\ \mu\text{A}$ , Recessive State	$V_{\text{LINhigh}}$	$V_{\text{SUP}} - 1.0$	–	–	V

Table 1. Explanation of Mode Transitions

Mode	Bus	INH	EN	TXD	RXD
Sleep	Recessive state, driver off. 20 μA pullup current source.	OFF	LOW	X	High impedance. HIGH if external pullup to V <sub>DD</sub> .
Awake	Recessive state, driver off. 30 kΩ pullup active.	ON	LOW	X	Low. If external pullup, HIGH-to-LOW transition reports wake-up.
Normal	Driver active. 30 kΩ pullup active. Slew rate normal (20 kbps).	ON	HIGH	HIGH to enter normal mode. Once in normal mode: LOW to drive bus in dominant, HIGH to drive bus in recessive.	Report bus level: • Low bus dominant • High bus recessive
Wait Slow	Recessive state. Driver off. 30 kΩ pullup active.	ON	HIGH	LOW	HIGH
Slow	Driver active. 30 kΩ pullup active. Slew rate slow (10 kbps).	ON	HIGH	LOW to enter slow mode. Once in slow mode: LOW to drive bus in dominant, HIGH to drive bus in recessive.	Report bus level: • Low bus dominant • High bus recessive
Fast	Driver active. 30 kΩ pullup active. Slew rate slow (> 100 kbps).	ON	HIGH	LOW to drive bus in dominant, HIGH to drive bus in recessive.	Report bus level: • Low bus dominant • High bus recessive

X = Don't care.

## SYSTEM/APPLICATION INFORMATION

### INTRODUCTION

The 33661 is a Physical Layer component dedicated to automotive LIN sub-bus applications.

The 33661 features include slew rate selection for optimized operation at 10 kbps and 20 kbps, fast baud rate for test and programming modes, excellent radiated emission performance, and safe behavior in case of LIN bus short-to-ground or LIN bus leakage during low power mode.

Digital inputs are 5.0 V and 3.3 V compatible without any external component required.

The INH output may be used to control an external voltage regulator or to drive a LIN bus pullup resistor.

### FUNCTIONAL TERMINAL DESCRIPTION

#### V<sub>SUP</sub> Supply Terminal

The V<sub>SUP</sub> supply terminal is the power supply terminal for the 33661.

#### LIN Bus Terminal

This I/O terminal represents the single-wire bus transmitter and receiver.

#### TXD Input Terminal

The TXD input terminal is the MCU interface to control the state of the LIN output. When TXD is LOW, LIN output is LOW; when TXD is HIGH, the LIN output transistor is turned OFF. The threshold is 3.3 V and 5.0 V compatible. The baud rate selection (normal or slow mode) is done at device wake-up by the state of the TXD terminal prior to a HIGH level at the EN terminal (see [Figures 5](#) through [10](#), page 10).

#### RXD Output Terminal

The RXD output terminal is the MCU interface, which reports the state of the LIN bus voltage. LIN HIGH (recessive) is reported by a high voltage on RXD; LIN LOW (dominant) is reported by a low voltage on RXD. The RXD output structure is a CMOS-type push-pull output stage.

The low level is fixed. The high level is dependant on the EN voltage. If EN is set at 3.3 V, RXD V<sub>OH</sub> is 3.3 V. If EN is set at 5.0 V, RXD V<sub>OH</sub> is 5.0 V.

In the sleep mode, RXD is high impedance. When a wake-up event is recognized from WAKE terminal or from the LIN bus terminal, RXD is pulled LOW to report the wake-up event. An external pullup resistor may be needed.

#### EN Input Terminal

The EN input terminal controls the operation mode of the interface. If EN = 1, the interface is in normal mode, with transmission path from TXD to LIN and from LIN to RXD both active. The threshold is 3.3 V and 5.0 V compatible. The high

level at EN defines the V<sub>OH</sub> at RXD. The sleep mode is entered by setting EN LOW while TXD is HIGH. Sleep mode is active after the t<sub>1</sub> filter time (see [Figure 12](#), page 11).

#### INH Output Terminal

The INH output terminal may have two main functions. It may be used to control an external switchable voltage regulator having an inhibit input. The high drive capability also allows it to drive the bus external resistor in the master node application. This is illustrated in [Figures 16](#) and [17](#), page 17.

In sleep mode, INH is turned OFF. If a voltage regulator inhibit input is connected to INH, the regulator will be disabled. If the master node pullup resistor is connected to INH, the pullup resistor will be disabled from the LIN bus.

#### WAKE Input Terminal

The WAKE terminal is a high-voltage input used to wake up the device from the sleep mode. WAKE is usually connected to an external switch in the application. The typical wake thresholds are V<sub>SUP</sub>/2.

The WAKE terminal has a special design structure and allows wake-up from both HIGH-to-LOW or LOW-to-HIGH transitions. When entering into sleep mode, the LIN monitors the state of the WAKE terminal and stores it as a reference state. The opposite state of this reference state will be the wake-up event used by the device to enter again into normal mode.

An internal filter is implemented (40 μs typical filtering time delay). WAKE terminal input structure exhibits a high impedance, with extremely low input current when voltage at this terminal is below 14 V. When voltage at the WAKE terminal exceeds 14 V, input current starts to sink into the device. A serial resistor should be inserted in order to limit the input current mainly during transient pulses. Recommended resistor value is 33 kΩ.

**Important** The WAKE terminal should *not* be left open. If the wake-up function is not used, WAKE should be connected to ground to avoid false wake-up.

## OPERATIONAL MODES

### Introduction

The 33661 has two communication modes, transmitting and receiving modes, and two operational modes, normal and sleep. The normal mode is differentiated by the slew rate—normal, slow, or fast—of the LIN output.

### Operational Modes

#### Normal Mode

In the normal mode, the 33661 has slew rate and timing compatible with the LIN protocol specification and can operate at 20 kbps. This mode is selected after sleep mode by setting the TXD terminal HIGH prior to setting EN from LOW to HIGH. Once normal mode is selected, it is impossible to select the slow mode unless the 33661 is set to sleep mode.

#### Slow Mode

In the slow mode, the slew rate is around half the normal slew rate, and bus speed operation is limited up to 10 kbps. The radiated emission is significantly reduced compared to the already excellent emission level of the normal mode. Slow mode is entered after sleep mode by setting the TXD terminal LOW prior to setting EN from LOW to HIGH. Once the slow mode is selected, it is impossible to select the normal mode unless the device is set to sleep mode.

#### Fast Mode

In the fast mode, the slew rate is around 10 times faster than the normal mode. This allows very fast data transmission (>100 kbps)—for instance, for ECU tests and microcontroller program download. The bus pullup resistor might be reduced to ensure a correct RC time constant in line with the high baud rate used. Fast mode is entered via a special sequence (call toggle function) at the TXD and EN terminals described in [Figure 11](#) on page 11. Fast mode can be selected from either normal or slow mode. Once in fast mode, the toggle function will bring the device back in the previously selected mode (normal or slow). A glitch on EN will also reset the device to the previously selected mode (normal or slow) as shown in [Figure 11](#) on page 11.

#### Sleep Mode

In the sleep mode, the transmission path is disabled and the 33661 is in low power mode. Supply current from  $V_{SUP}$  is very low. Wake-up can occur from LIN bus activity from node internal wake-up through the EN terminal and from the WAKE input terminal.

In the sleep mode, the 33661 has an internal 20  $\mu$ A pullup source to  $V_{SUP}$ . This avoids the high current path from the battery to ground in the event the bus is shorted to ground. (Refer to succeeding paragraphs describing wake-up behavior.)

#### Device Wake-Up Events

The 33661 can be awakened from sleep mode by three wake-up events: remote wake-up via LIN bus activity, internal node wake-up via the EN terminal, or toggling the WAKE terminal.

#### Remote Wake from LIN Bus

The LIN bus wake-up is recognized by a recessive-to-dominant transition, followed by a dominant level with a duration greater than 70  $\mu$ s, followed by a dominant-to-recessive transition. This is illustrated in [Figures 7](#) and [10](#) on page 10. Once the wake-up is detected, the 33661 enters the “awake” mode, with INH HIGH and RXD pulled LOW.

#### Wake-Up from Internal Node Activity

The 33661 can wake up by internal node activity through a LOW-to-HIGH transition of the EN terminal. When EN is switched from LOW to HIGH, the device is awakened and enters either the “normal” or the “wait slow” mode depending on the level of TXD input. The MCU must set the TXD terminal LOW or HIGH prior to waking up the device through the EN terminal.

#### Wake-Up from WAKE Terminal

If the WAKE input terminal is toggled, the 33661 enters the “awake” mode, with INH HIGH and RXD pulled LOW.

#### Device Power-Up

At power-up ( $V_{SUP}$  rises from zero), the 33661 automatically switches in the “awake” mode. It switches the INH terminal to HIGH state and RXD to LOW state. The MCU of the application will then confirm normal or slow mode by setting the TXD and EN terminals appropriately.

## ELECTROMAGNETIC COMPATIBILITY INFORMATION

### Radiated Emission in Normal and Slow Modes

The 33661 has been tested for radiated emission performances. [Figures 14](#) and [15](#) show the results in the frequency range 100 kHz to 2.0 MHz. Test conditions are in accordance with CISPR25 recommendations, bus length of 1.5 meter, device loaded with 10 nF and 500  $\Omega$  bus impedance.

[Figure 14](#) displays the results when the device is set in the normal mode, optimized for baud rate up to 20 kbps. [Figure 15](#) displays the results when the device is set in the slow mode, optimized for baud rate up to 10 kbps. The level of emissions is significantly reduced compared to the already excellent level of the normal mode.

## APPLICATIONS

### Motorola Device Compatibility: 33661 and 33399

The two Motorola devices are terminal-to-terminal compatible. [Table 2](#) summarizes the differences between the two devices.

**Table 2. Compatibility Comparison**

Parameter	33661	33399
Terminal Out and Package	8-terminal SOICN.	8-terminal SOICN.
Baud Rate Operation	2 baud rate operations: from 1.0 to 10 kbps and from 1.0 to 20 kbps.	1 baud rate operation from 1.0 to 20 kbps.
INH Output	Capable of: <ul style="list-style-type: none"> <li>Controlling an external switchable voltage regulator.</li> <li>Driving a bus master termination resistor.</li> </ul>	Capable of controlling an external switchable voltage regulator.
WAKE Terminal	Identical to 33399.	Identical to 33661.
TXD, RXD, EN	5.0 V and 3.3 V compatible.	5.0 V compatible only.
LIN Bus Termination	In normal, slow, and fast mode, 30 k $\Omega$ pullup. In sleep mode and bus short-to-ground, 20 $\mu$ A pullup.	30 k $\Omega$ pullup in normal and sleep modes.
Sleep Current	Typical 8.0 $\mu$ A.	Typical 20 $\mu$ A, maximum 50 $\mu$ A.
Mode	Normal, slow, fast, and sleep modes.	Normal and sleep modes.
Normal Mode	Selected by TXD HIGH, then EN HIGH at device wake-up. Operation up to 20 kbps.	Selected by TXD high and EN high at device wake-up. Operation up to 20 kbps.
Slow Mode	Selected by TXD LOW, then EN HIGH at device wake-up. Operation up to 10 kbps.	N/A
Fast Mode	Selected by sequence at TXD and EN. Operation at baud rate >100 kbps.	N/A
Sleep Mode and Bus Wake-Up	Recessive-to-dominant transition, followed by a dominant state of more than 70 $\mu$ s, followed by a dominant-to-recessive transition.	Dominant level, 50 $\mu$ s duration.
Slew Rate	Three slew rates: Normal (20 kbps), Slow (10 kbps), and Fast (> 100 kbps). Normal and slow mode selected by EN and TXD terminal sequence at device wake-up. The sequence to enter normal mode is the same for both the 33399 and 33661.	One slew rate: 20 kbps.
Wake-Up from Internal Node Activity (LOW to HIGH transition of EN)	If TXD is set HIGH and then EN is switched HIGH, the 33661 wakes up and the Normal Mode is selected. In this setup sequence, there is a direct compatibility between 33399 and 33661.	TXD must be set HIGH prior to setting EN HIGH in order to avoid having the device send a dominant level on the bus at wake-up.
Radiated Emission	The level of radiated emissions measured in identical configurations is lower for the 33661 compared to the 33399 in the normal mode, allowing operation up to 20 kbps. If the 33661 device is set to the slow mode, allowing operation up to 10 kbps, the radiated emission level is significantly reduced.	The level of radiated emissions measured in identical configurations is higher for the 33399 compared to the 33661 in the normal mode.

## Typical Applications

Figures 16 and 17 show typical applications of the 33661.

 ISSUE T

- NOTES:
1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
  2. DIMENSIONS ARE IN MILLIMETER.
  3. DIMENSION D AND E DO NOT INCLUDE MOLD PROTRUSION.
  4. MAXIMUM MOLD PROTRUSION 0.15 PER SIDE.
  5. DIMENSION B DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.127 TOTAL IN EXCESS OF THE B DIMENSION AT MAXIMUM MATERIAL CONDITION.

DIM	MILLIMETERS	
	MIN	MAX
A	1.35	1.75
A1	0.10	0.25
B	0.35	0.49
C	0.19	0.25
D	4.80	5.00
E	3.80	4.00
e	1.27 BSC	
H	5.80	6.20
h	0.25	0.50
