### ■ Overview

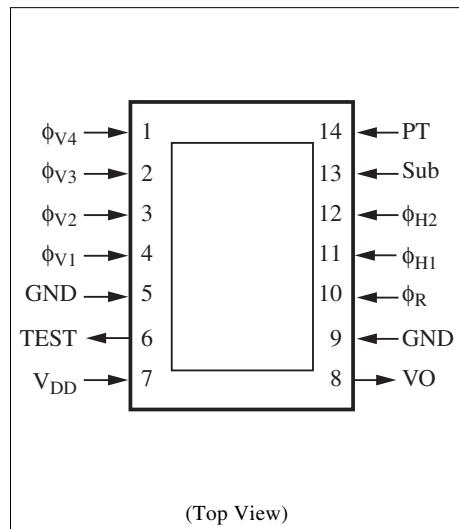

The MN39160FH is a 4.5 mm (type-1/4) interline transfer CCD (IT-CCD) solid state image sensor device.

This device uses photodiodes in the optoelectric conversion section and CCDs for signal readout. The electronic shutter function has made an exposure time of 1/10000 seconds possible. Further, this device has the features of high sensitivity, low noise, broad dynamic range, and low smear.

This device has a total of 681 739 pixels (1 007 horizontal  $\times$  677 vertical) and provides stable and clear images with a resolution of 600 horizontal TV-lines and 420 vertical TV-lines.

### Note) 1. Standard photo detecting condition

Standard photo detecting condition stands for detecting image with a light source of color temperature of 2856K, luminance of 1050 cd/m<sup>2</sup>, and using a color temperature conversion filter LB-40 (HOYA), infrared cut filter CAW-500S with thickness 2.5 mm for a light path and with F8 lens aperture. The quantity of the incidental light to a photo-detecting surface under the above condition is defined as the standard quantity of light.

### 2. \*1: $V_{Sub}$ when using electronic shutter function

\* φSub pulse generates once every 1 V period.

\*2:  $V_{Sub}$  supplied internally is the voltage suppressing the blooming generation at ×500 light quantity relative to the standard light quantity.

\*3: Relation between  $V_{PT}$  and  $V_{φVL}$

Set  $V_{PT}$  under the following condition against  $VL$  of a vertical transfer clock waveform.

$V_{PT} \leq VL$  ( $V_{φV1L}$  to  $V_{φV4L}$ )

\*4: Absolute maximum ratings       $-0.2 < V_{φV} - V_{PT} < 24.5$  (V)
