

FemtoClock™ Crystal-to-LVDS/LVCMOS Frequency

ICS8402015I

DATASHEET

General Description

ICS8402015I is a low phase noise Clock Synthesizer and is a member of the HiPerClockS™ family of high performance clock solutions from IDT. The device provides three banks of outputs and a reference clock. Each bank can be enabled by using output enable pins. A 25MHz or 50MHz, 18pF parallel resonant crystal is used to generate 25MHz LVCMOS, 125MHz LVCMOS and 125MHz LVDS outputs. ICS8402015I is packaged in a small, 32-pin VFQFN package that is optimum for applications with space limitations.

Features

- Three banks of outputs:
 - Bank A: three single-ended LVCMOS/LVTTL outputs at 25MHz or 50MHz
 - Bank B: three single-ended LVCMOS/LVTTL outputs at 125MHz
 - Bank C: three differential LVDS outputs at 125MHz
- Reference LVCMOS/LVTTL output at 25MHz
- Crystal input frequency: 25MHz
- Maximum output frequency: 125MHz
- RMS phase jitter @ 125MHz, using a 25MHz crystal (637kHz - 62.5MHz): 0.373ps (typical) LVDS output
- RMS phase jitter @ 25MHz, using a 25MHz crystal (12kHz - 1MHz): 0.64ps (typical) LVCMOS output
- Full 3.3V supply mode
- -40°C to 85°C ambient operating temperature
- Available in lead-free (RoHS 6) package

Table 1. Pin Descriptions

Number	Name	Type		Description
1	V _{DDO_REF}	Power		Output supply pin for REF_OUT output.
2	REF_OUT	Output		Reference clock output. LVCMOS/LVTTL interface levels.
3, 4, 13, 16, 25, 32	GND	Power		Power supply ground.
5, 6, 7	QA0, QA1, QA2	Output		Single-ended Bank A clock outputs. LVCMOS/LVTTL interface levels.
8	V _{DDO_A}	Power		Power output supply pin for Bank A LVCMOS outputs.
9	V _{DDO_B}	Power		Power output supply pin for Bank B LVCMOS outputs.
10, 11, 12	QB0, QB1, QB2	Output		Single-ended Bank B clock outputs. LVCMOS/LVTTL interface levels.
14	MR	Input	Pulldown	Master reset, resets the internal dividers. During reset, LVCMOS outputs are pulled LOW, and LVDS outputs are pulled LOW and HIGH (QCx pulled LOW, nQCx pulled HIGH). LVCMOS/LVTTL interface levels.
15	V _{DD}	Power		Core supply pin.
17, 24	V _{DDO_C}	Power		Power output supply pin for Bank C LVDS outputs.
18, 19	QC0, nQC0	Output		Differential Bank C clock outputs. LVDS interface levels.
20, 21	QC1, nQC1	Output		Differential Bank C clock outputs. LVDS interface levels.
22, 23	QC2, nQC2	Output		Differential Bank C clock outputs. LVDS interface levels.
26	V _{DDA}	Power		Analog supply pin.
27, 29	OE0, OE2	Input	Pulldown	Output enable and configuration pins. See Table 3. LVCMOS/LVTTL interface levels.
28	OE1	Input	Pullup	Output enable and configuration pin. See Table 3. LVCMOS/LVTTL interface levels.
30, 31	XTAL_IN, XTAL_OUT	Input		Crystal oscillator interface. XTAL_OUT is the output, XTAL_IN is the input.

NOTE: Pullup and Pulldown refer to internal input resistors. See Table 2, *Pin Characteristics*, for typical values.

Table 2. Pin Characteristics

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C _{IN}	Input Capacitance			4		pF
C _{PD}	Power Dissipation Capacitance (per output)	V _{DD} , V _{DDO_A} , V _{DDO_B} , V _{DDO_C} = 3.465V		15		pF

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, V_{DD}	4.6V
Inputs, V_I	-0.5V to $V_{DD} + 0.5V$
Outputs, I_O (LVCMOS)	-0.5V to $V_{DDO_LVCMOS} + 0.5V$
Outputs, I_O (LVDS) Continuous Current Surge Current	10mA 15mA
Operating Temperature Range, T_A	-40°C to +85°C
Package Thermal Impedance, θ_{JA}	37°C/W (0 mps)
Storage Temperature, T_{STG}	-65°C to 150°C

		QC[0:2]/ nQC[0:2]	20% to 80%	145		415	ps
odc	Output Duty Cycle	QA[0:2], QB[0:2], REF_OUT		48		52	%
		QC[0:2]/ nQC[0:2]		48		52	%

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 1: Please refer to Phase Noise Plots.

NOTE 2: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 3: Defined as skew within a bank of outputs at the same supply voltage and with equal load conditions.

Application Information

Power Supply Filtering Technique

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The ICS84020151 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{DD} , V_{DDA} , V_{DDO_A} , V_{DDO_B} , V_{DDO_C} , and V_{DDO_REF} should be individually connected to the power supply plane through vias, and $0.01\mu\text{F}$ bypass capacitors should be used for each pin. *Figure 1* illustrates this for a generic V_{DD} pin and also shows that V_{DDA} requires that an additional 10Ω resistor along with a $10\mu\text{F}$ bypass capacitor be connected to the V_{DDA} pin.

Figure 1. Power Supply Filtering

Recommendations for Unused Input and Output Pins

Inputs:

LVCMOS Control Pins

All control pins have internal pullups or pulldowns; additional resistance is not required but can be added for additional protection. A $1\text{k}\Omega$ resistor can be used.

Outputs:

LVDS Outputs

All unused LVDS outputs should be terminated with 100Ω resistor between the differential pair.

LVCMOS Outputs

All unused LVCMOS output can be left floating. There should be no trace attached.

Crystal Input Interface

The ICS8402015I has been characterized with 18pF parallel resonant crystals. The capacitor values shown in *Figure 2* below

were determined using a 25MHz, 18pF parallel resonant crystal and were chosen to minimize the ppm error.

Figure 2. Crystal Input Interface

LVCMOS to XTAL Interface

The XTAL_IN input can accept a single-ended LVCMOS signal through an AC coupling capacitor. A general interface diagram is shown in *Figure 3*. The XTAL_OUT pin can be left floating. The input edge rate can be as slow as 10ns. For LVCMOS signals, it is recommended that the amplitude be reduced from full swing to half swing in order to prevent signal interference with the power rail and to reduce noise. This configuration requires that the output

impedance of the driver (R_o) plus the series resistance (R_s) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R_1 and R_2 in parallel should equal the transmission line impedance. For most 50Ω applications, R_1 and R_2 can be 100Ω. This can also be accomplished by removing R_1 and making R_2 50Ω.

Figure 3. General Diagram for LVCMOS Driver to XTAL Input Interface

3.3V LVDS Driver Termination

A general LVDS interface is shown in *Figure 4*. In a 100Ω differential transmission line environment, LVDS drivers require a matched load termination of 100Ω across near the receiver input. For a multiple

LVDS outputs buffer, if only partial outputs are used, it is recommended to terminate the unused outputs.

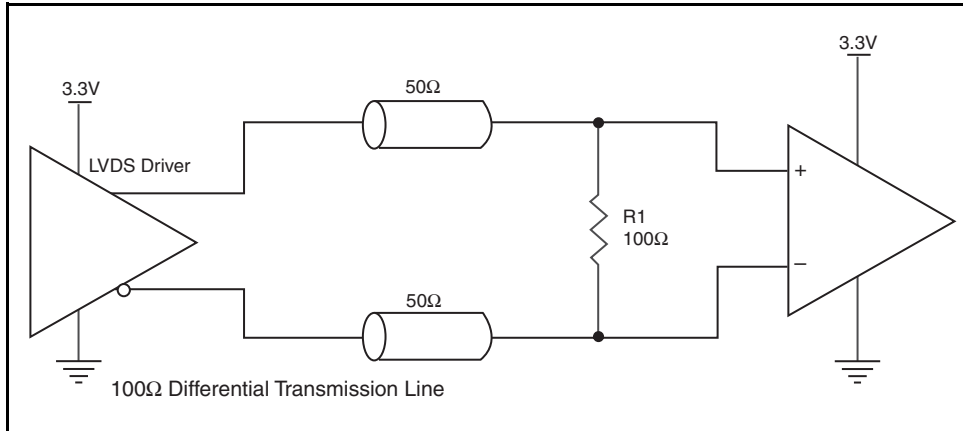

Figure 4. Typical LVDS Driver Termination

VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 5*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application specific

and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor’s Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.

Figure 5. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale)

Schematic Example

Figure 6 shows an example of ICS84020151 application schematic. In this example, the device is operated at $V_{DD} = V_{DDO_REF} = V_{DDO_A} = V_{DDO_B} = V_{DDO_C} = 3.3V$. The 18pF parallel resonant 25MHz crystal is used. The $C1 = 27pF$ and $C2 = 27pF$ are recommended for

frequency accuracy. For different board layouts, the $C1$ and $C2$ may be slightly adjusted for optimizing frequency accuracy. Two example of LVDS for receiver without built-in termination and one example of LVCMOS are shown in this schematic.

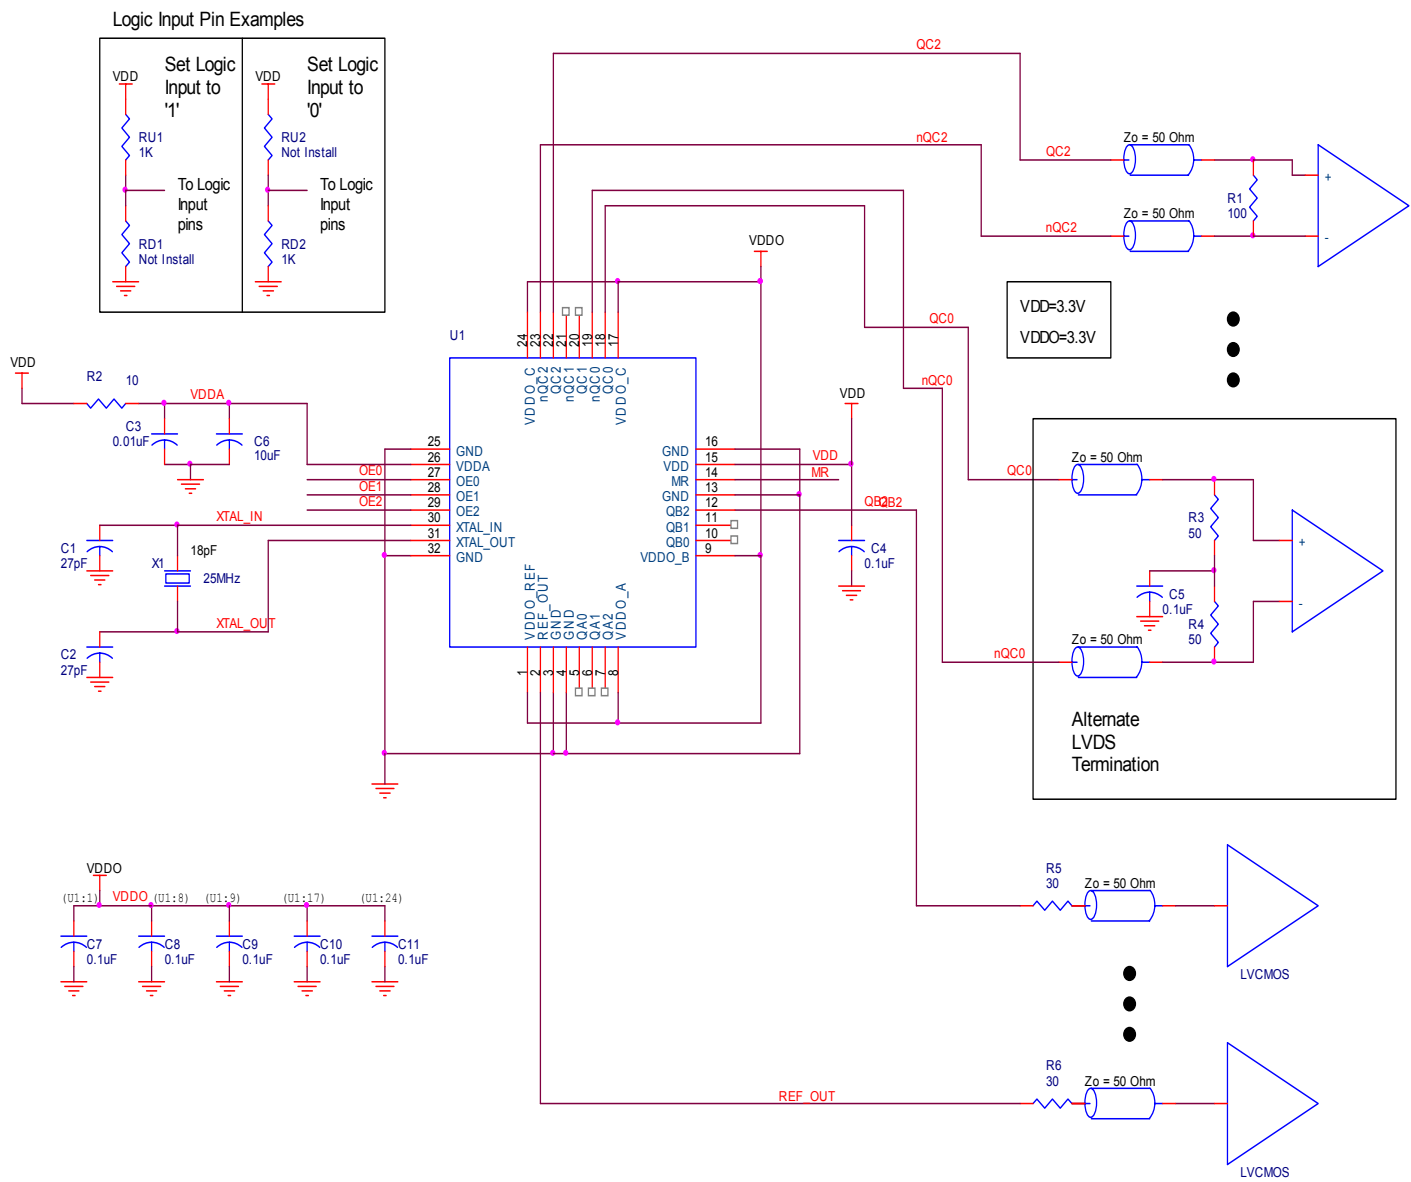

Figure 6. ICS84020151 Schematic Example

Power Considerations

This section provides information on power dissipation and junction temperature for the ICS84020151. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the ICS84020151 is the sum of the core power plus the analog power plus the power dissipated in the load(s). The following is the power dissipation for $V_{DD} = 3.3V + 5\% = 3.465V$, which gives worst case results.

Core and LVDS Output Power Dissipation

- Power (core, LVDS) = $V_{DD_MAX} * (I_{DD} + I_{DDO_X} + I_{DDA}) = 3.465V * (30mA + 26mA + 36mA) = \mathbf{318.78mW}$

LVCMOS Output Power Dissipation

- Output Impedance R_{OUT} Power Dissipation due to Loading 50Ω to $V_{DDO}/2$
Output Current $I_{OUT} = V_{DDO_MAX} / [2 * (50\Omega + R_{OUT})] = 3.465V / [2 * (50\Omega + 20\Omega)] = \mathbf{24.7mA}$
- Power Dissipation on the R_{OUT} per LVCMOS output
Power (R_{OUT}) = $R_{OUT} * (I_{OUT})^2 = 20\Omega * (24.7mA)^2 = \mathbf{12.25mW}$ per output
- Total Power Dissipation on the R_{OUT}
Total Power (R_{OUT}) = $12.25mW * 6 = 73.5mW$

Total Power Dissipation

- Total Power**
= Power (core, LVDS) + Total Power (R_{OUT})
= $318.78mW + 73.5mW$
= **392.28mW**

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS devices is 125°C .

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 37°C/W per Table 7 below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ\text{C} + 0.392W * 37^\circ\text{C/W} = 99.5^\circ\text{C}. \text{ This is below the limit of } 125^\circ\text{C}.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

Table 7. Thermal Resistance θ_{JA} for 32 Lead VFQFN, Forced Convection

θ_{JA} Vs. Air Flow			
Meters per Second	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	37.0°C/W	32.4°C/W	29.0°C/W
