

64M bits Mobile RAM™

EDL6416CBBH (4M words × 16 bits)

Specifications

- Density: 64M bits
- Organization: 1M words × 16 bits × 4 banks
- Package: 60-ball FBGA
 - Lead-free (RoHS compliant) and Halogen-free
- Power supply: VDD, VDDQ = 1.7V to 1.95V
- Clock frequency: 133MHz (max.)
- 1KB page size
 - Row address: A0 to A11
 - Column address: A0 to A7
- Four internal banks for concurrent operation
- Interface: LVCMOS
- Burst lengths (BL): 1, 2, 4, 8, full page
- Burst type (BT):
 - Sequential (1, 2, 4, 8, full page)
 - Interleave (1, 2, 4, 8)
- /CAS Latency (CL): 3
- Precharge: auto precharge option for each burst access
- Driver strength: normal/weak
- Refresh: auto-refresh, self-refresh
- Refresh cycles: 4096 cycles/64ms
 - Average refresh period: 15.6μs
- Operating ambient temperature range
 - TA = -25°C to +85°C

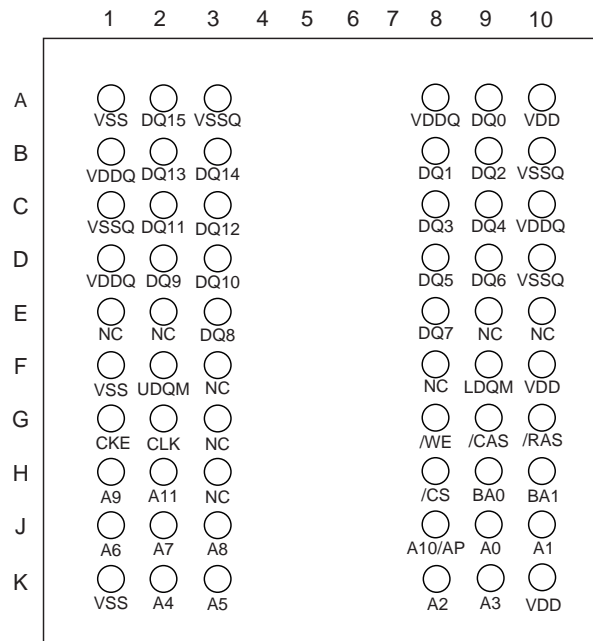

Features

- Low power consumption
- Single pulsed /RAS
- Burst read/write operation capability
- Byte control by DQM
- Programmable Partial Array Self-Refresh
- Auto Temperature Compensated Self-Refresh (ATCSR) by built-in temperature sensor
- Burst termination by burst stop command and Precharge command

Pin Configurations

/xxx indicates active low signal.

60-ball FBGA

(Top view)

A0 to A11	Address inputs
BA0, BA1	Bank select
DQ0 to DQ15	Data inputs/ outputs
CLK	Clock input
CKE	Clock enable
/CS	Chip select
/RAS	Row address strobe
/CAS	Column address strobe
/WE	Write enable
UDQM	Upper DQ mask enable
LDQM	Lower DQ mask enable
VDD	Power supply
VSS	Ground
VDDQ	Power supply for DQ
VSSQ	Ground for DQ
NC	No connection

Electrical Specifications

- All voltages are referenced to VSS (GND).
- After power up, wait more than 200 μ s and then, execute Power on sequence and two Auto Refresh before proper device operation is achieved.

Absolute Maximum Ratings

Parameter	Symbol	Rating	Unit	Note
Voltage on any pin relative to VSS	VT	-0.5 to +2.45	V	
Supply voltage relative to VSS	VDD, VDDQ	-0.5 to +2.45	V	
Short circuit output current	IOS	50	mA	
Power dissipation	PD	1.0	W	
Operating ambient temperature	TA	-25 to +85	°C	
Storage temperature	Tstg	-55 to +125	°C	

Caution

Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

Recommended DC Operating Conditions (TA = -25°C to +85°C)

Parameter	Symbol	min.	typ.	max.	Unit	Notes
Supply voltage	VDD	1.7	1.8	1.95	V	
	VSS, VSSQ	0	0	0	V	
DQ Supply voltage	VDDQ	1.7	1.8	1.95	V	
Input high voltage	VIH	$0.8 \times VDDQ$	—	$VDDQ + 0.3$	V	1
Input low voltage	VIL	-0.3	—	0.3	V	2

Notes: 1. VIH (max.) = 2.45V (pulse width \leq 5ns)

2. VIL (min.) = -0.5V (pulse width \leq 5ns)

DC Characteristics 1 (TA = -25°C to +85°C, VDD and VDDQ = 1.7V to 1.95V, VSS and VSSQ = 0V)

Parameter	Symbol	Grade	max.	Unit	Test condition	Notes
/CAS latency						
Operating current	IDD0		35	mA	Burst length = 1 tRC ≥ tRC (min.), IO = 0mA, One bank active	
Standby current in power down	IDD2P		0.8	mA	CKE ≤ VIL (max.), tCK (min.)	
Standby current in power down (input signal stable)	IDD2PS		0.6	mA	CKE ≤ VIL (max.), tCK = ∞	
Standby current in non power down	IDD2N		4.0	mA	CKE ≥ VIH (min.), tCK (min.), /CS ≥ VIH (min.), Input signals are changed one time during 2tCK.	
Standby current in non power down (input signal stable)	IDD2NS		2.0	mA	CKE ≥ VIH (min.), tCK = ∞, Address and Command Input signals are stable.	
Active standby current in power down	IDD3P		3.0	mA	CKE ≤ VIL (max.), tCK (min.)	
Active standby current in power down (input signal stable)	IDD3PS		2.0	mA	CKE ≤ VIL (max.), tCK = ∞	
Active standby current in non power down	IDD3N		10	mA	CKE ≥ VIH (min.), tCK (min.), /CS ≥ VIH (min.), Input signals are changed one time during 2tCK.	
Active standby current in non power down (input signal stable)	IDD3NS		7.0	mA	CKE ≥ VIH (min.), tCK = ∞, Address and Command Input signals are stable.	
Burst operating current	IDD4		50	mA	tCK ≥ tCK (min.), IOOUT = 0mA, All banks active	1
Refresh current	IDD5		70	mA	tRC1 ≥ tRC1 (min.)	2

Self Refresh Current (TA = -25°C to +85°C, VDD and VDDQ = 1.7V to 1.95V, VSS and VSSQ = 0V)

Self refresh current	Symbol	Grade	typ.	max.	Unit	Test Condition	Notes
PASR="000" (Full)	IDD6		—	120	μA	-25°C ≤ TA ≤ +45°C	3
PASR="001" (2BK)			—	90	μA	CKE ≤ 0.2V	
PASR="010" (1BK)			—	80	μA		
PASR="000" (Full)	IDD6		—	150	μA	+45°C < TA ≤ 85°C	3
PASR="001" (2BK)			—	120	μA	CKE ≤ 0.2V	
PASR="010" (1BK)			—	100	μA		

- Notes: 1. IDD4 depends on output loading and cycle rates. Specified values are obtained with the output open. In addition to this, IDD4 is measured on condition that addresses are changed only one time during tCK (min.).
2. IDD5 is measured on condition that addresses are changed only one time during tCK (min.).
3. IDD6 is specified when self refresh state is maintained long enough under the specified TA condition, after a busy sequence of read and write operations

DC Characteristics 2 (TA = -25°C to +85°C, VDD and VDDQ = 1.7V to 1.95V, VSS and VSSQ = 0V)

Parameter	Symbol	min.	max.	Unit	Test condition	Notes
Input leakage current	ILI	-2.0	2.0	μA	0 ≤ VIN ≤ VDDQ	
Output leakage current	ILO	-1.5	1.5	μA	0 ≤ VOUT ≤ VDDQ, DQ = disable	
Output high voltage	VOH	VDDQ - 0.2	—	V	IOH = -0.1 mA	
Output low voltage	VOL	—	0.2	V	IOL = 0.1 mA	

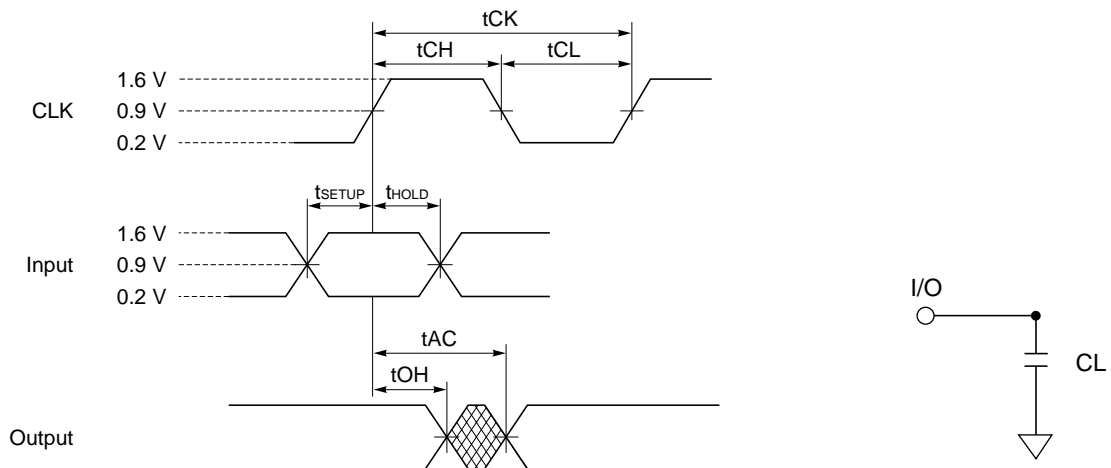

Pin Capacitance (TA = 25°C, f = 1MHz)

Parameter	Symbol	Pins	min.	typ.	max.	Unit	Notes
Input capacitance	CI1	CLK	2.0	—	4.5	pF	
	CI2	All other input-only pins	2.0	—	4.5	pF	
Data input/output capacitance	CI/O	DQ	3.5	—	6	pF	

AC Characteristics (TA = -25°C to +85°C, VDD and VDDQ = 1.7V to 1.95V, VSS and VSSQ = 0V)

Test Conditions

- AC high level input voltage / low level input voltage: 1.6 / 0.2V
- Input timing measurement reference level: 0.9V
- Transition time (Input rise and fall time): 0.5ns
- Output timing measurement reference level: 0.9V
- Output load: CL = 30pF

Synchronous Characteristics

Parameter	Symbol	min.	max.	Unit	Note
Clock cycle time (CL= 2)	tCK2	15	100	ns	
(CL= 3)	tCK3	7.5	100	ns	
Access time from CLK (CL= 2)	tAC2	—	8	ns	1
(CL= 3)	tAC3	—	5.4	ns	1
CLK high level width	tCH	2.5	—	ns	
CLK low level width	tCL	2.5	—	ns	
Data-out hold time	tOH	2.5	—	ns	1
Data-out low-impedance time	tLZ	1	—	ns	
Data-out high-impedance time (CL= 2)	tHZ2	0	8	ns	
(CL= 3)	tHZ3	0	5.4	ns	
Data-in setup time	tDS	1.9	—	ns	
Data-in hold time	tDH	0.9	—	ns	
Address setup time	tAS	1.9	—	ns	
Address hold time	tAH	0.9	—	ns	
CKE setup time	tCKS	1.9	—	ns	
CKE hold time	tCKH	0.9	—	ns	
CKE setup time (Power down exit)	tCKSP	1.9	—	ns	
Command (/CS, /RAS, /CAS, /WE, UDQM/LDQM) setup time	tCMS	1.9	—	ns	
Command (/CS, /RAS, /CAS, /WE, UDQM/LDQM) hold time	tCMH	0.9	—	ns	

Note: 1. Output load.: CL = 30pF

Asynchronous Characteristics

Parameter	Symbol	min.	max.	Unit	Notes
ACT to REF/ACT command period (operation)	tRC	75	—	ns	
REF to REF/ACT command period	tRC1	77	—	ns	
Self refresh exit to REF/ACT command period	tRC2	112.5	—	ns	
ACT to PRE command period	tRAS	52.5	120000	ns	
PRE to ACT command period	tRP	22.5	—	ns

Last data in to burst stop	tBDL	1	—	CLK	
Last data-in to new column address delay	tCDL	1	—	CLK	
Column address to column address delay	tCCD	1	—	CLK	

Pin Function

CLK (input pin)

CLK is the master clock input. Other inputs signals are referenced to the CLK rising edge.

CKE (input pins)

CKE determine validity of the next CLK (clock). If CKE is high, the next CLK rising edge is valid; otherwise it is invalid. If the CLK rising edge is invalid, the internal clock is not issued and the Mobile RAM suspends operation.

When the Mobile RAM is not in burst mode and CKE is negated, the device enters power down mode. During power down mode, CKE must remain low.

/CS (input pins)

/CS low starts the command input cycle. When /CS is high, commands are ignored but operations continue.

/RAS, /CAS, and /WE (input pins)

/RAS, /CAS and /WE have the same symbols on conventional DRAM but different functions. For details, refer to the command table.

A0 to A11 (input pins)

Row Address is determined by A0 to A11 at the CLK (clock) rising edge in the active command cycle. It does not depend on the bit organization.

Column Address (See "Address Pins Table") is determined by A0 to A7 at the CLK rising edge in the read or write command cycle.

[Address Pins Table]

Part number	Address (A0 to A11)	
	Row address	Column address
EDL6416CBBH	AX0 to AX11	AY0 to AY7

A10 defines the precharge mode. When A10 is high in the precharge command cycle, all banks are precharged; when A10 is low, only the bank selected by BA0 and BA1 is precharged.

When A10 is high in read or write command cycle, the precharge starts automatically after the burst access.

BA0 and BA1 (input pin)

BA0 and BA1 are bank select signal. (See Bank Select Signal Table)

[Bank Select Signal Table]

	BA0	BA1
Bank A	L	L
Bank B	H	L
Bank C	L	H
Bank D	H	H

Remark: H: VIH. L: VIL.

UDQM to LDQM (input pins)

UDQM and LDQM control upper byte and lower byte I/O buffers, respectively. In read mode, DQM controls the output buffers like a conventional /OE pin. DQM high and DQM low turn the output buffers off and on, respectively. The DQM latency for the read is two clocks. In write mode, DQM controls the word mask. Input data is written to the memory cell if DQM is low but not if DQM is high. The DQM latency for the write is zero.

DQ0 to DQ15 (input/output pins)

DQ pins have the same function as I/O pins on a conventional DRAM.

VDD, VSS, VDDQ, VSSQ (Power supply)

VDD and VSS are power supply pins for internal circuits. VDDQ and VSSQ are power supply pins for the output buffers.

Command Operation

Extended Mode register set command (/CS, /RAS, /CAS, /WE, BA0 = Low, BA1 = High)

The Mobile RAM has an extended mode register that defines low power functions. In this command, A0 through A11 are the data input pins.

After power on, the extended mode register set command must be executed to fix low power functions.

The extended mode register can be set only when all banks are in idle state.

During tRSC following this command, the Mobile RAM can not accept any other commands.

Extended Mode register set command

Mode register set command (/CS, /RAS, /CAS, /WE, BA0, BA1 = Low)

The Mobile RAM has a mode register that defines how the device operates. In this command, A0 through A11 are the data input pins. After power on, the mode register set command must be executed to initialize the device. The mode register can be set only when all banks are in idle state. During tRSC following this command, the Mobile RAM cannot accept any other commands.

Mode register set command

Activate command (/CS, /RAS = Low, /CAS, /WE = High)

The Mobile RAM has four banks, each with 4,096 rows. This command activates the bank selected by BA0 and BA1 and a row address selected by A0 through A11. This command corresponds to a conventional DRAM's /RAS falling.

Activate command

Precharge command (/CS, /RAS, /WE = Low, /CAS = High)

This command begins precharge operation of the bank selected by BA0 and BA1. When A10 is High, all banks are precharged, regardless of BA0 and BA1. When A10 is Low, only the bank selected by BA0 and BA1 is precharged. After this command, the Mobile RAM can't accept the activate command to the precharging bank during tRP (precharge to activate command period). This command corresponds to a conventional DRAM's /RAS rising.

Precharge command

Write command (/CS, /CAS, /WE = Low, /RAS = High)

This command sets the burst start address given by the column address to begin the burst write operation. The first write data in burst mode can input with this command with subsequent data on following clocks.

Write command

Read command (/CS, /CAS = Low, /RAS, /WE = High)

Read data is available after /CAS latency requirements have been met. This command sets the burst start address given by the column address.

Read command

Auto refresh command (/CS, /RAS, /CAS = Low, /WE, CKE = High)

This command is a request to begin the Auto refresh operation. The refresh address is generated internally. Before executing Auto refresh, all banks must be precharged. After this cycle, all banks will be in the idle (precharged) state and ready for a row activate command. During tRC1 period (from refresh command to refresh or activate command), the Mobile RAM cannot accept any other command

Auto refresh command

Self refresh entry command (/CS, /RAS, /CAS, CKE = Low, /WE = High)

After the command execution, self refresh operation continues while CKE remains low. When CKE goes high, the Mobile RAM exits the self refresh mode. During self refresh mode, refresh interval and refresh operation are performed internally, so there is no need for external control. Before executing self refresh, all banks must be precharged.

Self refresh entry command

Power down entry command (/CS, CKE = Low, /RAS, /CAS, /WE = High)

After the command execution, power down mode continues while CKE remains low. When CKE goes high, the Mobile RAM exits the power down mode. Before executing power down, all banks must be precharged.

Power down entry command

Burst stop command (/CS = /WE = Low, /RAS, /CAS = High)

This command can stop the current burst operation.

Burst stop command

No operation (/CS = Low, /RAS, /CAS, /WE = High)

This command is not an execution command. No operations begin or terminate by this command.

No operation

Truth Table**Command Truth Table**

Function	Symbol	CKE		/CS	/RAS	/CAS	/WE	BA1	BA0	A11, A9 - A0

Remark: H: VIH. L: VIL. ×: Don't care, V = Valid data

BA: Bank Address, CA: Column Address, RA: Row Address, OC: Op-Code

- Notes:
1. All entries assume that CKE is active ($CKE_{n-1}=CKE_n=H$).
 2. Illegal to bank in specified states; Function may be legal in the bank indicated by Bank Address (BA), depending on the state of that bank.
 3. Illegal if tRCD is not satisfied.
 4. Illegal if tRAS is not satisfied.
 5. Must satisfy burst interrupt condition.
 6. Must satisfy bus contention, bus turn around, and/or write recovery requirements.
 7. Must mask preceding data which don't satisfy tDPL.
 8. Illegal if tRRD is not satisfied.

Simplified State Diagram

Initialization

The synchronous DRAM is initialized in the power-on sequence according to the following.

- (1) To stabilize internal circuits, when power is applied, a 200 μ s or longer pause must precede any signal toggling. VDD should be turned on simultaneously or before VDDQ.
- (2) After the pause, all banks must be precharged using the Precharge command (The Precharge all banks command is convenient).
- (3) Once the precharge is completed and the minimum tRP is satisfied, two or more Auto refresh must be performed.
- (4) The mode register must be programmed and the extended mode register should be programmed. After the mode register set cycle or the extended mode register set cycle, tRSC (2 CLK minimum) pause must be satisfied.

Remarks:

- 1 The sequence of Auto refresh, mode register programming and extended mode register programming above may be transposed.
- 2 CKE and DQM must be held high until the Precharge command is issued to ensure data-bus High-Z.

Programming Mode Registers

The mode register and extended mode register are programmed by the Mode register set command and Extended mode register command, respectively using address bits A11 through A0, BA0 and BA1 as data inputs. The registers retain data until they are re-programmed or the device loses power.

Mode register

The mode register has four fields;

Reserved : A11 through A7
 /CAS latency : A6 through A4
 Wrap type : A3
 Burst length : A2 through A0

Following mode register programming, no command can be issued before at least 2 CLK have elapsed.

/CAS Latency

/CAS latency is the most critical of the parameters being set. It tells the device how many clocks must elapse before the data will be available. The value is determined by the frequency of the clock and the speed grade of the device.

Burst Length

Burst Length is the number of words that will be output or input in a read or write cycle. After a read burst is completed, the output bus will become High-Z. The burst length is programmable as 1, 2, 4, 8 or full page.

Wrap Type (Burst Sequence)

The wrap type specifies the order in which the burst data will be addressed. This order is programmable as either "Sequential" or "Interleave". The method chosen will depend on the type of CPU in the system.

Some microprocessor cache systems are optimized for sequential addressing and others for interleaved addressing. "Burst Length Sequence" shows the addressing sequence for each burst length using them. Both sequences support bursts of 1, 2, 4 and 8. Additionally, sequence supports the full page length.

Extended Mode Register

The extended mode register has four fields;

Reserved	: A11 through A7, A4, A3
Auto Temperature Compensated Self Refresh	: A9
Driver Strength	: A6 through A5
Partial Array Self Refresh	: A2 through A0

Following extended mode register programming, no command can be issued before at least 2 CLK have elapsed.

Driver Strength

By setting specific parameter on A6 and A5, driving capability of data output drivers is selected.

Auto Temperature Compensated Self Refresh (ATCSR)

With the built-in temperature sensor, the internal self refresh frequency is controlled autonomously.

Partial Array Self Refresh

Memory array size to be refreshed during self refresh operation is programmable in order to reduce power. Data outside the defined area will not be retained during self refresh.

Mode Register Definition

Operation of the Mobile RAM

Precharge

The precharge command can be issued anytime after $t_{RAS\ min.}$ is satisfied. Soon after the precharge command is issued, precharge operation performed and the selected bank(s) enters the idle state after t_{RP} is satisfied. The parameter t_{RP} is the time required to perform the precharge. The earliest timing in a read cycle that a precharge command can be issued without losing any data in the burst is as follows.

In order to write all data to the memory cell correctly, the asynchronous parameter t_{DPL} must be satisfied. The t_{DPL} (min.) specification defines the earliest time that a precharge command can be issued. Minimum number of clocks is calculated by dividing t_{DPL} (min.) with clock cycle time. In summary, the precharge command can be issued relative to reference clock that indicates the last data word is valid. In the following table, minus means clocks before the reference; plus means time after the reference.

/CAS latency	Read	Write
2	-1	+ $t_{DPL}(\min.)$
3	-2	+ $t_{DPL}(\min.)$

Auto Precharge

During a read or write command cycle, A10 controls whether auto precharge is selected. A10 high in the Read or Write command (Read with Auto precharge command or Write with Auto precharge command), auto precharge is selected and begins automatically. The tRAS must be satisfied with a read with auto precharge or a write with auto precharge operation. In addition, the next activate command to the bank being precharged cannot be executed until the precharge cycle ends.

In read cycle, once auto precharge has started, an activate command to the bank can be issued after tRP has been satisfied.

In write cycle, the tDAL must be satisfied to issue the next activate command to the bank being precharged.

The timing that begins the auto precharge cycle depends on whether read or write cycle.

Read with Auto Precharge

During a read cycle, the auto precharge begins one clock earlier (/CAS latency of 2) or two clocks earlier (/CAS latency of 3) the last data word output.

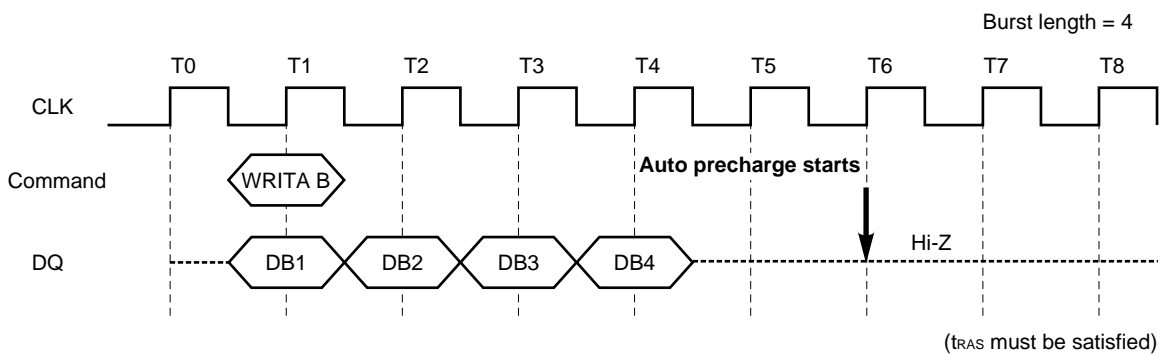

Read with Auto Precharge

Remark: READA means Read with Auto precharge

Write with Auto Precharge

During a write cycle, the auto precharge starts at the timing of 2 clocks after the last data word input to the device.

Write with Auto Precharge

Remark: WRITA means Write with Auto Precharge

Read / Write Command Interval

Read to Read Command Interval

During a read cycle, when new Read command is issued, it will be effective after /CAS latency, even if the previous read operation does not completed. READ will be interrupted by another READ. The interval between the commands is 1 cycle minimum. Each Read command can be issued in every clock without any restriction.

Write to Write Command Interval

During a write cycle, when a new Write command is issued, the previous burst will terminate and the new burst will begin with a new Write command. WRITE will be interrupted by another WRITE. The interval between the commands is minimum 1 cycle. Each Write command can be issued in every clock without any restriction.

Write to Read Command Interval

Write command and Read command interval is also 1 cycle. Only the write data before Read command will be written. The data bus must be High-Z at least one cycle prior to the first DOUT.

Read to Write Command Interval

During a read cycle, READ can be interrupted by WRITE. The Read and Write command interval is 1 cycle minimum. There is a restriction to avoid data conflict. The Data bus must be High-Z using DQM before WRITE.

Read to Write Command Interval 1

READ can be interrupted by WRITE. DQM must be High at least 3 clocks prior to the Write command.

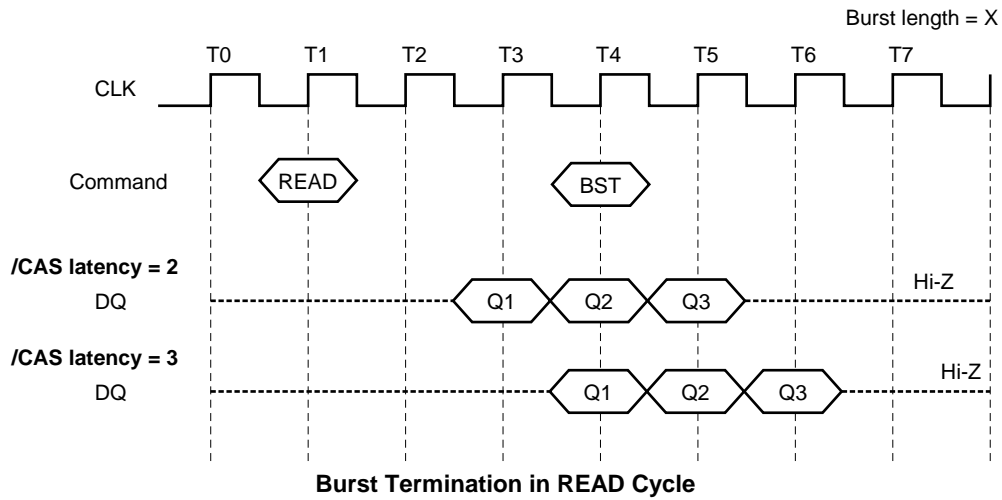

Read to Write Command Interval 2

Burst Termination

There are two methods to terminate a burst operation other than using a Read or a Write command. One is the burst stop command and the other is the precharge command.

Burst Termination in READ Cycle

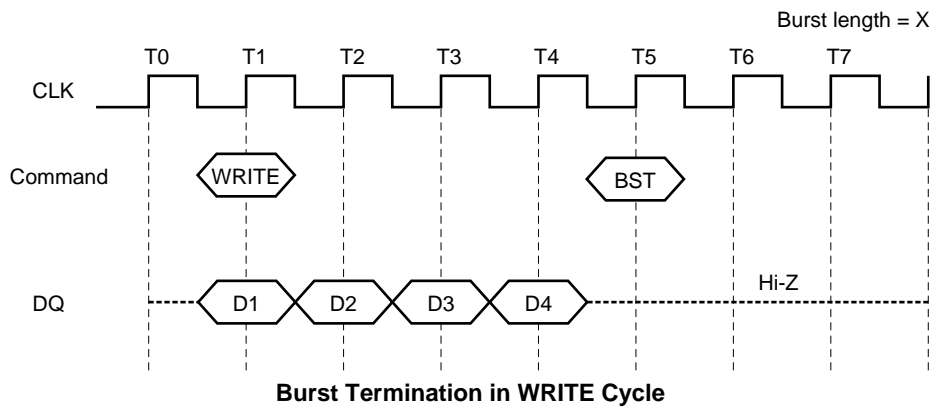

During a read cycle, when the burst stop command is issued, the burst read data are terminated and the data bus goes to High-Z after the /CAS latency from the burst stop command.

Remark: BST: Burst stop command

Burst Termination in WRITE Cycle

During a write cycle, when the burst stop command is issued, the burst write data are terminated and data bus goes to High-Z at the same clock with the burst stop command.

Remark: BST: Burst stop command

Precharge Termination in READ Cycle

During a read cycle, the burst read operation is terminated by a precharge command. When the precharge command is issued, the burst read operation is terminated and precharge starts. The same bank can be activated again after t_{RP} from the precharge command. To issue a precharge command, t_{RAS} must be satisfied.

When $/CAS$ latency is 2, the read data will remain valid until one clock after the precharge command.

Precharge Termination in READ Cycle (CL = 2)

When $/CAS$ latency is 3, the read data will remain valid until two clocks after the precharge command.

Precharge Termination in READ Cycle (CL = 3)

Precharge Termination in WRITE Cycle

During a write cycle, the burst write operation is terminated by a precharge command. When the precharge command is issued, the burst write operation is terminated and precharge starts. The same bank can be activated again after t_{RP} from the precharge command. To issue a precharge command, t_{RAS} must be satisfied.

The write data written up to two clocks prior to the precharge command will be correctly stored. However, invalid data may be written at the same clock as the precharge command and one clock before the precharge command. To prevent this from happening, DQM must be high and mask the invalid data.

Recommended Soldering Conditions

Please consult with our sales offices for soldering conditions of the EDL6416CBBH.

Type of Surface Mount Device

EDL6416CBBH: 60-ball FBGA < Lead free (Sn-Ag-Cu) >

NOTES FOR CMOS DEVICES**① PRECAUTION AGAINST ESD FOR MOS DEVICES**

Exposing the MOS devices to a strong electric field can cause destruction of the gate oxide and ultimately degrade the MOS devices operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it, when once it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. MOS devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. MOS devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor MOS devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS DEVICES

No connection for CMOS devices input pins can be a cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. The unused pins must be handled in accordance with the related specifications.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Power-on does not necessarily define initial status of MOS devices. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the MOS devices with reset function have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. MOS devices are not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for MOS devices having reset function.

CME0107

Mobile RAM is a trademark of Elpida Memory, Inc.

The information in this document is subject to change without notice. Before using this document, confirm that this is the latest version.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of Elpida Memory, Inc.

Elpida Memory, Inc. does not assume any liability for infringement of any intellectual property rights (including but not limited to patents, copyrights, and circuit layout licenses) of Elpida Memory, Inc. or third parties by or arising from the use of the products or information listed in this document. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of Elpida Memory, Inc. or others.

Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of the customer's equipment shall be done under the full responsibility of the customer. Elpida Memory, Inc. assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.

[Product applications]

Be aware that this product is for use in typical electronic equipment for general-purpose applications. Elpida Memory, Inc. makes every attempt to ensure that its products are of high quality and reliability. However, users are instructed to contact Elpida Memory's sales office before using the product in aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment, medical equipment for life support, or other such application in which especially high quality and reliability is demanded or where its failure or malfunction may directly threaten human life or cause risk of bodily injury.

[Product usage]

Design your application so that the product is used within the ranges and conditions guaranteed by Elpida Memory, Inc., including the maximum ratings, operating supply voltage range, heat radiation characteristics, installation conditions and other related characteristics. Elpida Memory, Inc. bears no responsibility for failure or damage when the product is used beyond the guaranteed ranges and conditions. Even within the guaranteed ranges and conditions, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Elpida Memory, Inc. products does not cause bodily injury, fire or other consequential damage due to the operation of the Elpida Memory, Inc. product.

[Usage environment]

Usage in environments with special characteristics as listed below was not considered in the design. Accordingly, our company assumes no responsibility for loss of a customer or a third party when used in environments with the special characteristics listed below.

Example:

- 1) Usage in liquids, including water, oils, chemicals and organic solvents.
- 2) Usage in exposure to direct sunlight or the outdoors, or in dusty places.
- 3) Usage involving exposure to significant amounts of corrosive gas, including sea air, CL₂, H₂S, NH₃, SO₂, and NO_x.
- 4) Usage in environments with static electricity, or strong electromagnetic waves or radiation.
- 5) Usage in places where dew forms.
- 6) Usage in environments with mechanical vibration, impact, or stress.
- 7) Usage near heating elements, igniters, or flammable items.

If you export the products or technology described in this document that are controlled by the Foreign Exchange and Foreign Trade Law of Japan, you must follow the necessary procedures in accordance with the relevant laws and regulations of Japan. Also, if you export products/technology controlled by U.S. export control regulations, or another country's export control laws or regulations, you must follow the necessary procedures in accordance with such laws or regulations.

If these products/technology are sold, leased, or transferred to a third party, or a third party is granted license to use these products, that third party must be made aware that they are responsible for compliance with the relevant laws and regulations.
