

# OL7272

Industrial 30 Volt 4-Channel Differential Power Linedriver - Short Circuit Proof -

## Applications

- Industrial encoder interfacing
- Industrial sensor interfacing
- Proximity switches
- Industrial controllers PLC
- Light barriers

## Features

- Max. voltage range from 4,5 V – 36 V
- Short circuit proof tri-state outputs drive up to 120mA sink / source
- Operating frequency up to 4 MHz
- Pin compatible with ET7272
- Dynamic peak current up to 1,5 Amp.
- High impedance CMOS / TTL compatible buffered inputs with hysteresis
- Outputs RS422A compatible
- Small package TSSOP (OL2068) available

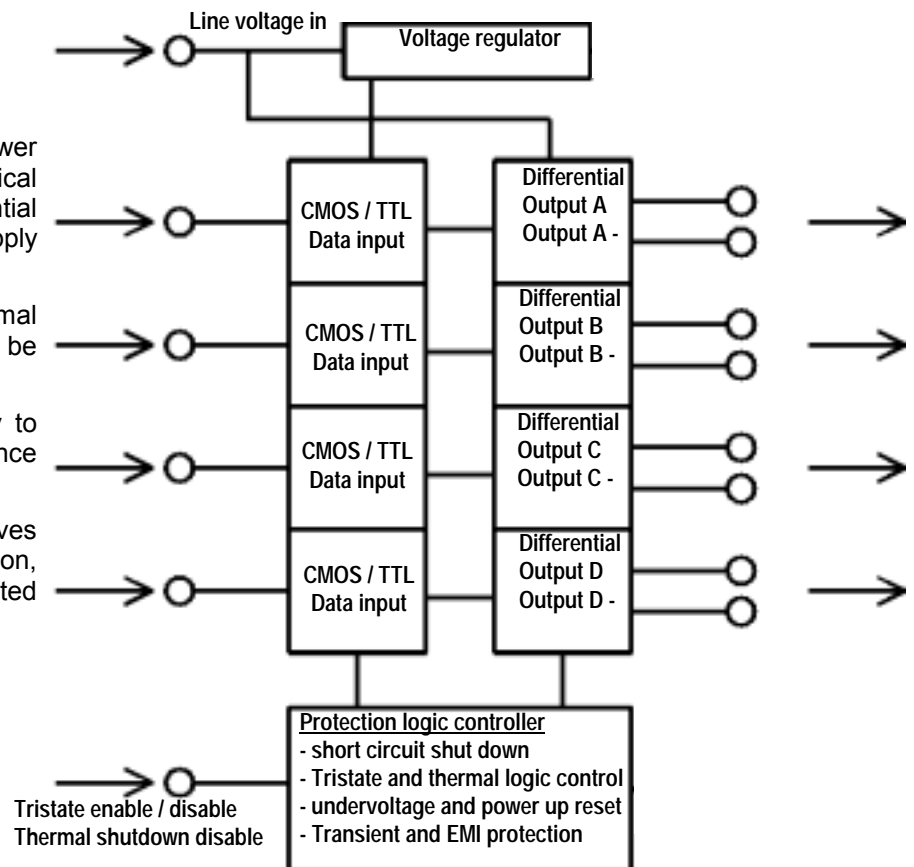

## General Description

The OL7272 is an industrial power linedriver and contains four identical short circuit proof differential linedrivers up to 30 Volts driver supply with a joint enable function.

At overload there is a thermal shutdown feature which can be disabled by the user.

The high data rate and immunity to cable inductance and capacitance makes an ideal linedriver.

The small outline SOP package gives excellent thermal power dissipation, thus the usage in space limited applications is easy.

**Industrial 30 Volt 4-Channel Differential Power Linedriver - short circuit proof -  
Electrical characteristics**

All voltage values are referenced to GND (GND = 0V).  
Unless stated otherwise all signals are assumed to be high active.

**Table 1 Absolute Maximum Ratings**

Parameter	Symbol	Condition	Min	Max	Unit
DC supply voltage	V <sub>CCD</sub>		-0.3	36.0	V
DC input voltage	V <sub>IN</sub>		-0.3	V <sub>CC</sub> + 0.3	V
DC input current	I <sub>IN</sub>			± 10	mA
Output voltage	V <sub>OUT</sub>		-0.3	V <sub>CC</sub> + 0.3	V
Driver output current ( <b>see cable model</b> )	I <sub>OUT</sub>	pulse peak/average		1500/120	mA
Storage and operating temperature range	T <sub>STGOP</sub>		-55	+125	°C

Lead temperature	T <sub>L</sub>	soldering, 10s		+260 <sup>2</sup>	°C
Power dissipation: <b>OL7272 SOIC16NB: R<sub>th j-a</sub> = 111.8 K/W</b>	PD	T <sub>J</sub> = 150 °C		581	mW

**Table 2 Recommended Operating Conditions**

Parameter	Symbol	Condition	Min	Max	Unit
DC supply voltage	V <sub>CCD</sub>		4.5	30.0	V
DC data input voltage	V <sub>IND</sub>		0	V <sub>CCD</sub>	V
DC enable input voltage	V <sub>INEN</sub> <sup>3</sup>		0	5.5	V
Data output voltage	V <sub>OUTD</sub>		0	V <sub>CCD</sub>	V
Driver output current ( <b>see cable model</b> )	I <sub>OUT</sub> <sup>4</sup>			100	mA
Operating ambient temperature range	T <sub>A</sub> <sup>5</sup>		-40	+125	°C
Junction temperature range (lifetime)	T <sub>J</sub>		-55	+140	°C

**NOTE:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability (eq. hot carrier degradation).

<sup>1</sup> Look at over-temperature protection Table 3

<sup>2</sup> For surface mounting plastic packages.

<sup>3</sup> Valid for normal function. To disable automatic thermal shutdown, this pin should be set to 7,5 – 12 Volt.

<sup>4</sup> Limited by power dissipation.

<sup>5</sup> Driving capability at elevated temperatures will be limited by total package power dissipation. Special packages up to 125°C can be supplied.

**Industrial 30 Volt 4-Channel Differential Power Linedriver - short circuit proof -  
Functional description**

The main contents of this new CMOS power linedriver are four identical blocks (systems A to D) with each a CMOS/TTL Schmitt Trigger Input ( can be driven at up to  $V_{DD}$  as well ) and high power differential buffered and inverted outputs.

With the low active ENABLE pin it is possible to switch off all eight outputs (high-impedance state), thus this driver can be used in industrial bus systems.

In some rare applications it might be useful to disable the overtemperature shutdown. This can be done by setting the ENABLE pin to a level between  $>7,5\text{ V}$  and  $<12\text{ V}$ . In this case the whole protection of the IC is disabled ! In case of any short circuits or thermal overdrive, the driver might be destroyed !

An internal ultra low drop voltage regulator with typical  $5.0\text{ V}$  supplies the internal logic to reduce power dissipation.

The over-temperature protection block is placed in the center of the chip. The thermal shutdown will be activated, when a overload condition (i.e. short circuit) has exceeded the over-temperature detection threshold.

In this case automatically all output drivers are switched off. After the chip has cooled down ( a few milliseconds ) it automatically re-activates all functions. In case the short circuit is still present, it switches off again and the same cycle starts from the beginning.

By using this linedriver, the field returns of systems, which are accidentally shorted and blown by the endusers, are dramatically reduced.

The OL7272 is pin compatible to a couple of popular other linedrivers like 26xx31, ET7272 etc.

**Power supply**

The internal power supply is designed as a voltage regulator with a typical output voltage  $V_{CC1} = 5.0\text{ V}$ . The minimal voltage drop across the regulator transistors could not be lower than  $0.3\text{ V}$ .

**Under-voltage reset**

If the system is switched on, the status of the linedriver is, for a few microseconds, undefined. The same happens, if heavy power supply failures occur. To avoid wrong data transmitted, there is a supply voltage watchdog implemented.

The under-voltage reset block contains a comparator. The voltage  $V_{CC1}$  will be always compared with a reference voltage, provided by an internal bandgap cell.

If after a filter time ( $t_{FILVLR} \sim 5\ \mu\text{s}$ )  $V_{CC1}$  drops below the typical voltage threshold of  $3.5\text{ V}$  the output signal of this block switches off all output drivers to the high-impedance state until minimum  $3.6\text{ V}$  are reappearing.

**ESD / EMI**

The chip is an ESD sensitive device and should be handled according to guideline EN100015 / part 1 („The Protection of ESD Sensitive Devices,,).

All pins are ESD protected according to ESD standard MIL883, method 3015.7 (human body model). Unused Inputs should be connected to GND, as well as the pin ENABLE in case this function is not used. This will reduce the quiescent supply current.

**Life support clause**

The schematics and in general the linedriver is not intended for use in life support appliances, critical components or systems without the express written consent of Optolab Microsystems GmbH. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.

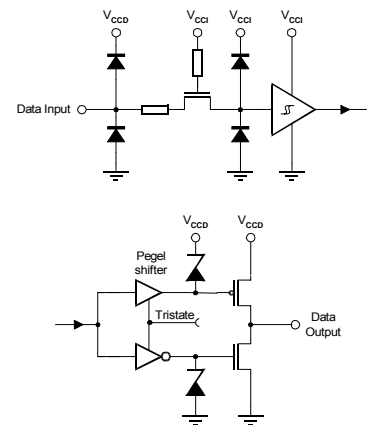

2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

**Industrial 30 Volt 4-Channel Differential Power Linedriver - short circuit proof -****Functional blocks****Figure 8****High voltage Data inputs**

All Data input pins with Schmitt trigger characteristics on CMOS/TTL level can handle input voltages up to  $V_{DD}$ . The input circuitry will be powered by an internal low drop voltage regulator.

**Figure 9****Push-pull Data outputs**

For minimizing cross talk and maintaining the very high switching speed each driver stage has it's own level shift pre-driver. Therefore the digital waveform characteristics has a superior frequency response.

**Over-temperature protection**

An over-temperature detection and protection is implemented to prevent the output drivers from overheating and being destroyed.

If the temperature increases with growing power dissipation and the junction temperature exceeds the absolute maximum value with typical  $T_{JOP} \sim 165 \text{ }^\circ\text{C}$  then this condition causes the thermal shutdown by switching off all output drivers to their high-impedance state. After cooling down below the release point the driver will continue his operation.

**Over temperature disable**

The only way to realize this function without a separate pin is the use of a special voltage range on the ENABLE pin.

**Figure 10****ENABLE input with temp. disable signal generation**

The implementation of one voltage threshold above the valid functional range allows the realization of an additional function. Again – by using this mode the linedriver is no longer protected ! If there is a voltage  $> 7,5\text{V}$  and  $< 12\text{V}$  applied to the ENABLE pin, the temperature shutdown will be disabled.

## Industrial 30 Volt 4-Channel Differential Power Linedriver - short circuit proof -

### Linedriver applications

For differential linedriver application it is recommended to use shielded twisted pair cable. Unfortunately this type of cable is not widely used. A more realistic load circuit is therefore shown in Figure 13. A long cable model is shown in Figure 14.

**Figure 12**  
**Twisted Pair transmission lines**

**Figure 13**  
**Load circuit for differential transmission Lines**

RL	120 Ω	350 Ω	700 Ω
VCCD	5 V	12 V	24 V

Parameter	Condition	
	VCCD	ILOAD
RL	4.5 V	20 mA
	30 V	30 mA

**Figure 14** Long cable model ( 100 m / 330 ft ) for differential transmission lines

**Linedrivers may be used in parallel to drive higher loads.**  
**For engineering purpose there is a demo board available, please contact factory**
