## 384-OUTPUT TFT-LCD SOURCE DRIVER (COMPATIBLE WITH 64-GRAY SCALES)

## DESCRIPTION

The $\mu$ PD16732E is a source driver for TFT-LCDs capable of dealing with displays with 64 -gray scales. Data input is based on digital input configured as 6 bits by 6 dots ( 2 pixels), which can realize a full-color display of 260,000 colors by output of 64 values $\gamma$-corrected by an internal D/A converter and 5-by-2 external power modules. Because the output dynamic range is as large as $\mathrm{V}_{\mathrm{ss} 2}+0.1 \mathrm{~V}$ to $\mathrm{V}_{\mathrm{DD} 2}-0.1 \mathrm{~V}$, level inversion operation of the LCD's common electrode is rendered unnecessary. Also, to be able to deal with dot-line inversion, n-line inversion and column line inversion when mounted on a single side, this source driver is equipped with a built-in 6-bit D/A converter circuit whose odd output pins and even output pins respectively output gray scale voltages of differing polarity. Assuring a maximum clock frequency of 65 MHz when driving at $3.0 \mathrm{~V}, 45 \mathrm{MHz}$ when driving at 2.3 V , this driver is applicable to XGA-standard TFT-LCD panels and SXGA-standard TFT-LCD panels.

## FEATURES

- CMOS level input (2.3 to 3.6 V )
- 384 outputs
- Input of 6 bits (gray-scale data) by 6 dots
- Capable of outputting 64 values by means of 5-by-2 external power modules (10 units) and a D/A converter
- Logic power supply voltage (VDD1): 2.3 to 3.6 V
- Driver power supply voltage (VDD2): 8.0 to 9.0 V
- Output dynamic range: Vss2 +0.1 V to $\mathrm{V}_{\mathrm{DD} 2}-0.1 \mathrm{~V}$
- High-speed data transfer: fcLk $=65 \mathrm{MHz}$ (internal data transfer speed when operating at $\mathrm{V}_{\mathrm{DD1}}=3.0 \mathrm{~V}$ )
- Apply for dot-line inversion, n-line inversion and column line inversion
- Output voltage polarity inversion function (POL)
- Display data inversion function (capable of controlling by each input port) (POL21, POL22)
- Current consumption reduction function (LPC, Bcont)
- Succession of $\mu$ PD16732B driver

## ORDERING INFORMATION

| Part Number | Package |
| :---: | :---: |
| $\mu$ PD16732EN-xxx | TCP (TAB package $)$ |

Remark The TCP's external shape is customized. To order the required shape, so please contact one of our sales representatives.

The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.
Not all devices/types available in every country. Please check with local NEC representative for availability and additional information.

## 1. BLOCK DIAGRAM

Remark /xxx indicates active low signal.

## 2. RELATIONSHIP BETWEEN OUTPUT CIRCUIT AND D/A CONVERTER

## 3. PIN CONFIGURATION (Top of copper foil surface, face-up)

$\mu$ PD16732EN-xxx: TCP (TAB package)

Remark This figure does not specify the TCP package.

## 4. PIN FUNCTIONS

| Pin Symbol | Pin Name | 1/O | Description |
| :---: | :---: | :---: | :---: |
| $\mathrm{S}_{1}$ to $\mathrm{S}_{384}$ | Driver output | Output | The D/A converted 64-gray-scale analog voltage is output. |
| D00 to D05 | Display data input | Input | The display data is input with a width of 36 bits, viz., the gray scale data ( 6 bits) by 6 dots (2 pixels). <br> Dxo: LSB, Dxs: MSB |
| $\mathrm{D}_{10}$ to $\mathrm{D}_{15}$ |  |  |  |
| $\mathrm{D}_{20}$ to $\mathrm{D}_{25}$ |  |  |  |
| $\mathrm{D}_{30}$ to $\mathrm{D}_{35}$ |  |  |  |
| $D_{40}$ to $D_{45}$ |  |  |  |
| $\mathrm{D}_{50}$ to $\mathrm{D}_{55}$ |  |  |  |
| R,/L | Shift direction control | Input | The shift direction control pin of the shift register. The shift directions of the shift registers are as follows. <br> $R, L=H$ (right shift): STHR (input), $S_{1} \rightarrow S_{384}$, STHL (output) <br> $R, / L=L$ (left shift) : STHL (input), $S_{384} \rightarrow S_{1}$, STHR (output) |
| STHR | Right shift start pulse | I/O | These refer to the start pulse I/O pins when the IC is connected in cascade. <br> Loading of display data starts when a high level is read at the rising edge of CLK. <br> A high level should be input as the pulse of one cycle of the clock signal. <br> If the start pulse input is more than 2CLK, the first 1CLK of the high-level input is valid. <br> $\mathrm{R}, / \mathrm{L}=\mathrm{H}$ (right shift): STHR input, STHL output <br> $R, / L=L$ (left shift): STHL input, STHR output |
| STHL | Left shift start pulse | 1/O |  |
| CLK | Shift clock | Input | This pi refers to the shift register's shift clock input. The display data is incorporated into the data register at the rising edge. At the rising edge of the 64th after the start pulse input, the start pulse output reaches the high level, thus becoming the start pulse of the next-level driver. When the 66 clock pulses are input after input of the start pulse, input of display data is halted automatically. The contents of the shift register are cleared at the STB's rising edge. |
| STB | Latch | Input | The contents of the data register are transferred to the latch circuit at the rising edge. And, at the falling edge, the gray scale voltage is supplied to the driver. It is necessary to ensure input of one pulse per horizontal period. |
| POL | Polarity | Input | POL = L: The $\mathrm{S}_{2 n-1}$ output uses $\mathrm{V}_{0}$ to $\mathrm{V}_{4}$ as the reference supply. The $\mathrm{S}_{2 n}$ output uses $\mathrm{V}_{5}$ to $\mathrm{V}_{9}$ as the reference supply. <br> POL $=\mathrm{H}$ : The $\mathrm{S}_{2 n-1}$ output uses $\mathrm{V}_{5}$ to $\mathrm{V}_{9}$ as the reference supply. The $\mathrm{S}_{2 n}$ output uses $\mathrm{V}_{0}$ to $\mathrm{V}_{4}$ as the reference supply. <br> $\mathrm{S}_{2 n-1}$ indicates the odd output: and $\mathrm{S}_{2 n}$ indicates the even output. Input of the POL signal is allowed the setup time (tpol-sтв) with respect to STB's rising edge. |
| POL21, <br> POL22 | Data inversion | Input | Data inversion can invert when display data is loaded. <br> POL21: $D_{00}$ to $D_{05,} D_{10}$ to $D_{15, ~} D_{20}$ to $D_{25}$ Data inversion or no inversion of Port1 POL22: $D_{30}$ to $D_{35, ~} D_{40}$ to $D_{45, ~} D_{50}$ to $D_{55}$ Data inversion or no inversion of Port2 POL21,POL22 = H: Data inversion loads display data inside the IC. POL21,POL22 = L: Data inversion does not invert input data. |
| LPC | Low power control | Input | The current consumption is lowered by controlling the constant current source of the output amplifier. In low power mode ( $L P C=L$ ), the Vod2 of static current consumption can be reduced to two thirds of the normal current consumption. This pin is pulled up to the VDD1 power supply inside the IC. <br> LPC = H or open: Normal power mode <br> LPC = L: Low power mode |
| Bcont | Bias control | Input | This pin can be used to finely control the bias current inside the output amplifier. In cases when fine-control is necessary, connect this pin to the stabilized ground potential (Vss2) via an external resistor of 10 to $100 \mathrm{k} \Omega$ (per IC). <br> When this fine-control function is not required, leave this pin open. <br> Refer to 9. CURRENT CONSUMPTION REDUCTION FUNCTION |

| Pin Symbol | Pin Name | $\mathrm{I} / \mathrm{O}$ | Description |
| :--- | :--- | :---: | :--- |
| $\mathrm{V}_{0}$ to $\mathrm{V}_{9}$ | $\gamma$-corrected power | - | Input the $\gamma$-corrected power supplies from outside by using operational amplifier. |
| supplies |  | Make sure to maintain the following relationships. During the gray scale voltage output, <br> be sure to keep the gray scale level power supply at a constant level. <br> $V_{D D 2}-0.1 \mathrm{~V} \geq \mathrm{V}_{0}>\mathrm{V}_{1}>\mathrm{V}_{2}>\mathrm{V}_{3}>\mathrm{V}_{4} \geq 0.5 \mathrm{VDD2}$ <br> $0.5 \mathrm{~V}_{\mathrm{DD} 2} \geq \mathrm{V}_{5}>\mathrm{V}_{6}>\mathrm{V}_{7}>\mathrm{V}_{8}>\mathrm{V}_{9} \geq \mathrm{V}_{\mathrm{SS} 2}+0.1 \mathrm{~V}$ |  |
| $\mathrm{~V}_{\mathrm{DD} 1}$ | Logic power supply | - | 2.3 to 3.6 V |
| $\mathrm{~V}_{\mathrm{DD} 2}$ | Driver power supply | - | 8.0 to 9.0 V |
| $\mathrm{~V}_{\mathrm{SS} 1}$ | Logic ground | - | Grounding |
| $\mathrm{V}_{\mathrm{SS} 2}$ | Driver ground | - | Grounding |

Cautions 1. The power start sequence must be $V_{D D 1}$, logic input, and $V_{D D 2} \& V_{0}$ to $V_{9}$ in that order. Reverse this sequence to shut down (Simultaneous power application to $\mathrm{V}_{\mathrm{DD} 2}$ and $\mathrm{V}_{0}$ to $\mathrm{V}_{9}$ is possible.).
2. To stabilize the supply voltage, please be sure to insert a $0.1 \mu \mathrm{~F}$ bypass capacitor between Vdd1-Vss1 and Vdd2-Vss2. Furthermore, for increased precision of the D/A converter, insertion of a bypass capacitor of about $0.01 \mu \mathrm{~F}$ is also recommended between the $\boldsymbol{\gamma}$-corrected power supply terminals ( $\mathrm{V}_{0}, \mathrm{~V}_{1}, \mathrm{~V}_{2}, \ldots . ., \mathrm{V}_{9}$ ) and $\mathrm{V}_{\mathrm{ss} 2}$.

## 5. RELATIONSHIP BETWEEN INPUT DATA AND OUTPUT VOLTAGE VALUE

The $\mu$ PD16732E incorporates a 6-bit D/A converter whose odd output pins and even output pins output respectively gray scale voltages of differing polarity with respect to the LCD's counter electrode voltage. The D/A converter consists of ladder resistors and switches. The ladder resistors ( $r_{0}$ to r62) are designed so that the ratio of LCD panel $\gamma$-compensated voltages to $\mathrm{V}_{0}$ ' to $\mathrm{V}_{63}{ }^{\prime}$ and $\mathrm{V}_{0} "$ to $\mathrm{V}_{63}$ " is almost equivalent as shown in Figure 5 -2. For the 2 sets of five $\gamma$-compensated power supplies, $\mathrm{V}_{0}$ to $\mathrm{V}_{4}$ and $\mathrm{V}_{5}$ to $\mathrm{V}_{9}$, respectively, input gray scale voltages of the same polarity with respect to the common voltage. When fine-gray scale voltage precision is not necessary, there is no need to connect voltage follower circuit to the $\gamma$-corrected power supplies $\mathrm{V}_{1}$ to $\mathrm{V}_{3}$ and $\mathrm{V}_{6}$ to $\mathrm{V}_{8}$.
Figure 5-1 shows the relationship between the driving voltages such as liquid-crystal driving voltages VdD2, Vss2 and $\gamma$-corrected voltages $\mathrm{V}_{0}$ to $\mathrm{V}_{9}$ and the input data. Be sure to maintain the voltage relationships as follows.

$$
\begin{aligned}
& V_{\mathrm{DD} 2}-0.1 \mathrm{~V} \geq \mathrm{V}_{0}>\mathrm{V}_{1}>\mathrm{V}_{2}>\mathrm{V}_{3}>\mathrm{V}_{4} \geq 0.5 \mathrm{~V}_{\mathrm{DD} 2}, \\
& 0.5 \mathrm{~V}_{\mathrm{DD} 2} \geq \mathrm{V}_{5}>\mathrm{V}_{6}>\mathrm{V}_{7}>\mathrm{V}_{8}>\mathrm{V}_{9} \geq \mathrm{V}_{\mathrm{SS} 2}+0.1 \mathrm{~V}
\end{aligned}
$$

Figures 5-2 indicates $\gamma$-corrected voltages and ladder resistors ratio. Figures 5-3 indicates the relationship between the input data and output voltage and the resistance values of the resistor string.

Figure 5-1. Relationship between Input Data and $\boldsymbol{\gamma}$-corrected Power Supplies

Figure 5-2. $\gamma$-corrected Voltages and Ladder Resistor's Ratio

Caution There is no connection between $\mathrm{V}_{4}$ and $\mathrm{V}_{5}$ terminal in the IC.

Remark The resistance ratio1 is a relative ratio in the case of setting the minimum resistance value to 1. The resistance ratio2 is a relative ratio in the case of setting the total resistance to 1 .

Figure 5-3. Relationship between Input Data and Output Voltage (POL21, POL22 = L)
(Output Voltage 1) $\mathrm{V}_{\mathrm{DD} 2}-0.1 \mathrm{~V} \geq \mathrm{V}_{5}>\mathrm{V}_{6}>\mathrm{V}_{7}>\mathrm{V}_{8}>\mathrm{V}_{9} \geq 0.5 \mathrm{~V}_{\mathrm{dD} 2}$,
(Output Voltage 2) $0.5 \mathrm{~V}_{\mathrm{DD} 2} \geq \mathrm{V}_{5}>\mathrm{V}_{6}>\mathrm{V}_{7}>\mathrm{V}_{8}>\mathrm{V}_{9} \geq \mathrm{V}_{\mathrm{SS} 2}+0.1 \mathrm{~V}$

| 3FH | $\mathrm{V}_{63}{ }^{\prime}$ | $\mathrm{V}_{4}$ |  | $\mathrm{V}_{63}{ }^{\prime \prime}$ | $\mathrm{V}_{5}$ |  |

Caution There is no connection between $\mathrm{V}_{4}$ and $\mathrm{V}_{5}$ terminal in the IC.

## 6. RELATIONSHIP BETWEEN INPUT DATA AND OUTPUT PIN

Data format: 6 bits $\times 2$ RGBs ( 6 dots)
Input width : 36 bits (2-pixel data)
(1) $R, / L=H$ (Right shift)

| Output | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ | $\ldots$ | $S_{383}$ | $S_{384}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Data | $D_{00}$ to $D_{05}$ | $D_{10}$ to $D_{15}$ | $D_{20}$ to $D_{25}$ | $D_{30}$ to $D_{35}$ | $\ldots$ | $D_{40}$ to $D_{45}$ | $D_{50}$ to $D_{55}$ |

(2) $R, / L=L$ (Left shift)

| Output | $S_{1}$ | $S_{2}$ | $S 3$ | $S_{4}$ | $\ldots$ | $S_{383}$ | $S_{384}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Data | $D_{00}$ to $D_{05}$ | $D_{10}$ to $D_{15}$ | $D_{20}$ to $D_{25}$ | $D_{30}$ to $D_{35}$ | $\ldots$ | $D_{40}$ to $D_{45}$ | $D_{50}$ to $D_{55}$ |

| POL | $\mathrm{S}_{2 n-1}$ Note | $\mathrm{S}_{2 n}$ Note |
| :---: | :--- | :--- |
| L | $\mathrm{V}_{0}$ to $\mathrm{V}_{4}$ | $\mathrm{~V}_{5}$ to $\mathrm{V}_{9}$ |
| H | $\mathrm{V}_{5}$ to $\mathrm{V}_{9}$ | $\mathrm{~V}_{0}$ to $\mathrm{V}_{4}$ |

Note $\mathrm{S}_{2 n-1}$ (Odd output), $\mathrm{S}_{2 n}$ (Even output)

## 7. RELATIONSHIP BETWEEN STB, POL AND OUTPUT WAVEFORM

The output voltage is written to the LCD panel synchronized with the STB falling edge.

## 8. RELATIONSHIP BETWEEN STB, CLK, AND OUTPUT WAVEFORM

The output voltage is written to the LCD panel synchronized with the STB falling edge.

Figure 8-1. Output Circuit Block Diagram

Figure 8-2. Output Circuit Block Diagram

Remarks 1. $\mathrm{STB}=\mathrm{L}: \mathrm{SW} 1=\mathrm{ON}$

$$
\mathrm{STB}=\mathrm{H}: \mathrm{SW} 1=\mathrm{OFF}
$$

2. $\mathrm{STB}=\mathrm{H}$ is acknowledged at timing [1].
3. The display data latch is completed at timing [2] and the input voltage ( $\mathrm{VAMP}_{\mathrm{AMP}}(\mathbb{N})$ : gray-scale level voltage) of the output amplifier changes.

## 9. CURRENT CONSUMPTION REDUCTION FUNCTION

The $\mu$ PD16732E has a low power control function (LPC) which can switch the bias current of the output amplifier between two levels and a bias control function (Bcont) which can be used to finely control the bias current.

## <Low power control function (LPC)>

The bias current of the output amplifier can be switched between two levels using this pin. (Bcont: open)

$$
\begin{aligned}
& \text { LPC }=\mathrm{H} \text { or open: } \text { normal power mode } \\
& \text { LPC }=\mathrm{L} \text { : low power mode }
\end{aligned}
$$

The VDD2 of static current consumption can be reduced to two thirds of that in normal mode, input a stable DC current ( $\mathrm{VDD1}_{1 /} / \mathrm{VSS}_{1}$ ) to this pin.

## <Bias current control function (Bcont)>

It is possible to fine-control the current consumption by using the bias current control function (Bcont pin). When using this function, connect this pin to the stabilized ground potential (Vss2) via an external resistor (Rext). When not using this function, leave this pin open.

Figure 9-1. Bias Current Control Function (Bcont)

Refer to the table below for the percentage of current regulation when using the bias current control-function.

Table 9-1. Current Consumption Regulation Percentage Compared to Normal Mode

| (VDd1 = 3.3 V, Vdd2 = 8.7 V, LPC = 3.3 V/ O V) |  |  |
| :---: | :---: | :---: |
| RExt (k 2 ) | Current Consumption Regulation Percentage (\%) |  |
|  | LPC $=\mathrm{H}$ | LPC = L |
| $\infty$ (Open) | 100 | 65 |
| 50 | 110 | 70 |
| 20 | 115 | 80 |
| 10 | 120 | 85 |

Remark Be aware that the above current consumption regulation percentages are not product-characteristic guaranteed as they are based on the results of simulation.

Caution Because the low-power and bias-current control functions control the bias current in the output amplifier and regulate the over-all current consumption of the driver IC, when this occurs, the characteristics of the output amplifier will simultaneously change. Therefore, when using these functions, be sure to sufficiently evaluate the picture quality.

Figure9-2. Output Wave Form (LPC = L)

<Test Condition>

Figure9-3. Output Wave Form (LPC = H)

## 10. ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings $\left(\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{Vss} 1=\mathrm{Vss} 2=0 \mathrm{~V}\right)$

| Parameter | Symbol | Rating | Unit |
| :--- | :--- | :--- | :---: |
| Logic Part Supply Voltage | $\mathrm{V}_{\mathrm{DD} 1}$ | -0.5 to +4.0 | V |
| Driver Part Supply Voltage | $\mathrm{V}_{\mathrm{DD} 2}$ | -0.5 to +10.0 | V |
| Logic Part Input Voltage | $\mathrm{V}_{11}$ | -0.5 to $\mathrm{V}_{\mathrm{DD} 1}+0.5$ | V |
| Driver Part Input Voltage | $\mathrm{V}_{12}$ | -0.5 to $\mathrm{V}_{\mathrm{DD} 2}+0.5$ | V |
| Logic Part Output Voltage | $\mathrm{V}_{\mathrm{O} 1}$ | -0.5 to $\mathrm{V}_{\mathrm{DD} 1}+0.5$ | V |
| Driver Part Output Voltage | $\mathrm{V}_{\mathrm{O} 2}$ | -0.5 to $\mathrm{V}_{\mathrm{DD} 2}+0.5$ | -10 to +75 |
| Operating Ambient Temperature | $\mathrm{T}_{\mathrm{A}}$ | -55 to +125 | V |
| Storage Temperature | $\mathrm{T}_{\mathrm{stg}}$ |  | ${ }^{\circ} \mathrm{C}$ |

Caution Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

Recommended Operating Range ( $\mathrm{T}_{\mathrm{A}}=\mathbf{- 1 0}$ to $+\mathbf{7 5}{ }^{\circ} \mathrm{C}, \mathrm{Vss} 1=\mathrm{Vss2}=0 \mathrm{~V}$ )

| Parameter | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Logic Part Supply Voltage | VDD1 |  | 2.3 |  | 3.6 | V |
| Driver Part Supply Voltage | VDD2 |  | 8.0 | 8.5 | 9.0 | V |
| High-Level Input Voltage | $\mathrm{V}_{\mathrm{IH}}$ |  | 0.7 VDD1 |  | VDD1 | V |
| Low-Level Input Voltage | VIL |  | 0 |  | $0.3 \mathrm{VDD1}$ | V |
| $\gamma$-Corrected Voltage | $\mathrm{V}_{0}$ to $\mathrm{V}_{4}$ |  | 0.5 V DD2 |  | VDD2 - 0.1 | V |
|  | $\mathrm{V}_{5}$ to $\mathrm{V}_{9}$ |  | Vss2 +0.1 |  | $0.5 \mathrm{VDD2}$ | V |
| Driver Part Output Voltage | Vo |  | Vss2 +0.1 |  | VDD2 - 0.1 | V |
| Clock Frequency | fcLk | $2.3 \leq \mathrm{VDD}<3.0 \mathrm{~V}$ |  |  | 45 | MHz |
|  |  | $3.0 \leq \mathrm{VDD} 1 \leq 3.6 \mathrm{~V}$ |  |  | 65 | MHz |

Electrical Characteristics ( $\mathrm{T}_{\mathrm{A}}=-10$ to $+75^{\circ} \mathrm{C}, \mathrm{VDD1}=2.3$ to $3.6 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD} 2}=8.0$ to $9.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{ss} 1}=\mathrm{V}_{\mathrm{ss} 2}=0 \mathrm{~V}$, Unless otherwise specified, LPC $=\mathrm{H}$ or open, Bcont $=$ open)

| Parameter | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Input Leak Current | IIL |  |  |  | $\pm 1.0$ | $\mu \mathrm{A}$ |
| High-Level Output Voltage | Vон | STHR (STHL), $\mathrm{IoH}=0 \mathrm{~mA}$ | VDD1-0.1 |  |  | V |
| Low-Level Output Voltage | Vol | STHR (STHL), lol $=0 \mathrm{~mA}$ |  |  | 0.1 | V |
| $\gamma$-Corrected Resistance | $\mathrm{R}_{\gamma}$ | $\mathrm{V}_{0}$ to $\mathrm{V}_{4}=\mathrm{V}_{5}$ to $\mathrm{V}_{9}=4.0 \mathrm{~V}$ | 8 | 16 | 32 | $\Omega$ |
| Driver Output Current | Ivoh | $\mathrm{V} x=7.0 \mathrm{~V}$, Vout $=6.5 \mathrm{~V}^{\text {Note }}$ |  |  | -30 | $\mu \mathrm{A}$ |
|  | Ivol | $\mathrm{V} x=1.0 \mathrm{~V}$, Vout $=1.5 \mathrm{~V}$ Note | 30 |  |  | $\mu \mathrm{A}$ |
| Output Voltage Deviation | $\Delta \mathrm{V}_{\text {o }}$ | $\begin{aligned} & V_{D D 1}=3.3 \mathrm{~V}, \mathrm{~V} D D 2^{=} 8.5 \mathrm{~V} \\ & V_{\text {OUT }}=2.0 \mathrm{~V}, 4.25 \mathrm{~V}, 6.5 \mathrm{~V} \end{aligned}$ |  | $\pm 7$ | $\pm 20$ | mV |
| Output Swing Difference Deviation | $\Delta \mathrm{V}$ P-P |  |  | $\pm 2$ | $\pm 15$ | mV |
| Output Voltage Range | Vo | All input data | 0.1 |  | VDD2 - 0.1 | V |
| Logic Part Dynamic Current Consumption | IDD1 | VDD1, with no load |  | 3.0 | 6.0 | mA |
| Driver Part Dynamic Current Consumption | IDD21 | $V_{D D 2}=8.0$ to 9.0 V , with no load, <br> LPC =H, Bcont = open |  | 1.0 | 6.0 | mA |
|  | IDD22 | $V_{D D 2}=8.0$ to 9.0 V , with no load, <br> LPC =L, Bcont = open |  | 2.0 | 4.0 | mA |

Note $V_{x}$ refers to the output voltage of analog output pins $S_{1}$ to $S_{384}$.
Vout refers to the voltage applied to analog output pins $\mathrm{S}_{1}$ to $\mathrm{S}_{384}$.

Cautions 1. STB cycle is $\mathbf{2 0} \boldsymbol{\mu \mathrm { s }}$, fclk $=\mathbf{4 0} \mathbf{~ M H z}$
2. The TYP. values refer to an all black or all white input pattern. The MAX. value refers to the measured values in the dot checkerboard input pattern.
3. Refers to the current consumption per driver when cascades are connected under the assumption of XGA single-sided mounting (8 units).

Switching Characteristics ( $\mathrm{T}_{\mathrm{A}}=-10$ to $+75^{\circ} \mathrm{C}, \mathrm{VDD}_{\mathrm{D} 1}=2.3$ to $3.6 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD} 2}=8.0$ to $9.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{ss} 1}=\mathrm{V}_{\mathrm{ss} 2}=0 \mathrm{~V}$, Unless otherwise specified, LPC = H or open, Bcont =open)

| Parameter | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Start Pulse Delay Time | tPLH1 | $\mathrm{CL}_{\mathrm{L}}=10 \mathrm{pF}, 2.3 \leq \mathrm{V}_{\mathrm{DD} 1}<3.0 \mathrm{~V}$ |  | 10 | 17 | ns |
|  |  | $\mathrm{CL}_{\mathrm{L}}=10 \mathrm{pF}, 3.0 \leq \mathrm{VDD} 1 \leq 3.6 \mathrm{~V}$ |  | 7 | 10.5 | ns |

|  | tPHL3 |  |  | 5 | 8 | $\mu \mathrm{s}$ |
| Input Capacitance | $\mathrm{Cl}_{11}$ | Exclude STHR (STHL), $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ |  | 5 | 10 | pF |
|  | $\mathrm{Cl}_{12}$ | STHR (STHL), $\mathrm{T}_{\text {A }}=25^{\circ} \mathrm{C}$ |  | 8 | 10 | pF |

## <Test Condition>

Timing Requirements ( $\mathrm{T}_{\mathrm{A}}=\mathbf{- 1 0}$ to $+75^{\circ} \mathrm{C}, \mathrm{VdD} 1=2.3$ to $3.6 \mathrm{~V}, \mathrm{Vss} 1=0 \mathrm{~V}, \mathrm{tr}_{\mathrm{t}}=\mathrm{t}_{\mathrm{t}}=8.0 \mathrm{~ns}$ )

| Parameter | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Clock Pulse Width | PWclk | $2.3 \leq \mathrm{VDD} 1<3.0 \mathrm{~V}$ | 22 |  |  | ns |
|  |  | $3.0 \leq \mathrm{VDD} 1 \leq 3.6 \mathrm{~V}$ | 15 |  |  | ns |
| Clock Pulse High Period | PWCLK(H) |  | 4 |  |  | ns |
| Clock Pulse Low Period | PWCLK(L) | $2.3 \leq \mathrm{VDD} 1^{<} 3.0 \mathrm{~V}$ | 6 |  |  | ns |
|  |  | $3.0 \leq \mathrm{VDD} 1 \leq 3.6 \mathrm{~V}$ | 4 |  |  | ns |
| Data Setup Time | tsetup1 |  | 4 |  |  | ns |
| Data Hold Time | thold 1 |  | 0 |  |  | ns |
| Start Pulse Setup Time | tsetup2 |  | 4 |  |  | ns |
| Start Pulse Hold Time | thold2 |  | 0 |  |  | ns |
| POL21/22 Setup Time | tsetup3 |  | 4 |  |  | ns |
| POL21/22 Hold Time | thold 3 |  | 0 |  |  | ns |
| STB Pulse Width | PW ${ }_{\text {sti }}$ |  | 2 |  |  | CLK |
| Last Data Timing | tldt |  | 2 |  |  | CLK |
| CLK-STB Time | tcLk-STB | CLK $\uparrow \rightarrow$ STB $\uparrow$ | 6 |  |  | ns |
| STB-CLK Time | tstb-clk | STB $\uparrow \rightarrow$ CLK $\uparrow$, $\mathrm{V}_{\mathrm{DD} 1}=2.3 \text { to } 3.6 \mathrm{~V}$ | 9 |  |  | ns |
|  |  | STB $\uparrow \rightarrow$ CLK $\uparrow$, $V_{D D 1}=3.0 \text { to } 3.6 \mathrm{~V}$ | 6 |  |  | ns |
| Time Between STB and Start Pulse | tstb-STH | STB $\uparrow \rightarrow$ STHR(STHL) $\uparrow$ | 2 |  |  | CLK |
| POL-STB Time | tpol-stB | POL $\uparrow$ or $\downarrow \rightarrow$ STB $\uparrow$ | -5 |  |  | ns |
| STB-POL Time | tstb-PoL | STB $\downarrow \rightarrow \mathrm{POL} \downarrow$ or $\uparrow$ | 6 |  |  | ns |

Remark Unless otherwise specified, the input level is defined to be $\mathrm{V}_{\mathrm{I}}=0.7 \mathrm{VDD1}$, $\mathrm{V}_{\mathrm{IL}}=0.3 \mathrm{VDD1}$.

## 11. RECOMMENDED MOUNTING CONDITIONS

The following conditions must be met for mounting conditions of the $\mu$ PD16732E.
For more details, refer to the Semiconductor Device Mounting Technology Manual (C10535E).
Please consult with our sales offices in case other mounting process is used, or in case the mounting is done under different conditions.
$\mu$ PD16732EN-xxx : TCP (TAB Package)

| Mounting Condition | Mounting Method | Condition |
| :--- | :--- | :--- |
| Thermocompression | Soldering | Heating tool 300 to $350^{\circ} \mathrm{C}$, heating for 2 to 3 seconds : pressure 100 g <br> (per solder) |
|  | ACF | Temporary bonding 70 to $100^{\circ} \mathrm{C}:$ pressure 3 to $8 \mathrm{~kg} / \mathrm{cm}^{2}:$ time 3 to 5 <br> sec. Real bonding 165 to $180^{\circ} \mathrm{C}$ : pressure 25 to $45 \mathrm{~kg} / \mathrm{cm}^{2}:$ time 30 to <br> 40 sec. (When using the anisotropy conductive film SUMIZAC1003 of <br> Sumitomo Bakelite,Ltd). |

Caution To find out the detailed conditions for mounting the ACF part, please contact the ACF manufacturing company. Be sure to avoid using two or more mounting methods at a time.

## NOTES FOR CMOS DEVICES

## (1) PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note:
Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

## (2) HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:
No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to VDD or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

## (3) STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:
Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.
- No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.
- NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC semiconductor products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC semiconductor products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment, and anti-failure features.
- NEC semiconductor products are classified into the following three quality grades:
"Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.
"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots
"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)
"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.
The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.
(Note)
(1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.
(2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).
