## MC9S08GW64 Series

Covers: MC9S08GW64 and  
MC9S08GW32

Document Number: MC9S08GW64

Rev. 1, 5/2010

80-LQFP  
Case 917A  
14 × 14

64-LQFP  
Case 840F  
10 × 10

comparator can be used as hardware breakpoint. Full mode, Comparator A compares address and Comparator B compares data. Supports both tag and force breakpoints

### 8-Bit HCS08 Central Processor Unit (CPU)

- New version of S08 core with same performance as traditional S08 and lower power
- Up to 20 MHz CPU at 3.6 V to 2.15 V and up to 10 MHz CPU at 2.15 V to 1.8 V, across temperature range of –40 °C to 85 °C
- HC08 instruction set with added BGND instruction
- Support for up to 48 interrupt/reset sources

### On-Chip Memory

- Flash read/program/erase over full operating voltage and temperature
- Random-access memory (RAM)
- Security circuitry to prevent unauthorized access to RAM and flash contents

### Power-Saving Modes

- Two low power stop modes and reduced power wait mode
- Low power run and wait modes allow peripherals to run while voltage regulator is in standby
- Peripheral clock gating register can disable clocks to unused modules, thereby reducing currents
- Very low power external oscillator that can be used in stop2 or stop3 modes to provide accurate clock source to real time counter
- 6 μs typical wakeup time from stop3 mode

### Clock Source Options

- Oscillator (XOSC1) — Loop-control Pierce oscillator; Crystal or ceramic resonator of 32.768 kHz; Clock source for iRTC or ICS
- Oscillator (XOSC2) — Loop-control Pierce oscillator; Crystal or ceramic resonator range of 31.25 kHz to 38.4 kHz or 1 MHz to 16 MHz; optional clock source for ICS
- Internal Clock Source (ICS) — Internal clock source module containing a frequency-locked-loop (FLL) controlled by internal or external reference (XOSC1, XOSC2); precision trimming of internal reference allows 0.2% resolution and 2% deviation over temperature and voltage; supporting CPU/bus frequencies from 1 MHz to 20 MHz

### System Protection

- Watchdog computer operating properly (COP) reset with option to run from dedicated 1 kHz internal clock source or bus clock
- Low-voltage warning with interrupt
- Low-voltage detection with reset or interrupt
- Illegal opcode and illegal address detection with reset
- Flash block protection

### Development Support

- Single-wire background debug interface
- Breakpoint capability to allow single breakpoint setting during in-circuit debugging (plus 3 more breakpoints in breakpoint unit)
- Breakpoint (BKPT) debug module containing three comparators (A, B, and C) with ability to match addresses in 64 KB space. Each

### Peripherals

- **LCD** — up to 4×40 or 8×36 LCD driver with internal charge pump and option to provide an internally regulated LCD reference that can be trimmed for contrast control
- **ADC16** — two analog-to-digital converters; 16-bit resolution; one dedicated differential per ADC; up to 16-ch; up to 2.5 μs conversion time for 12-bit mode; automatic compare function; hardware averaging; calibration registers; temperature sensor; internal bandgap reference channel; operation in stop3; fully functional from 3.6 V to 1.8 V
- **PRACMP** — three rail to rail programmable reference analog comparator; up to 8 inputs; on-chip programmable reference generator output; selectable interrupt on rising, falling, or either edge of comparator output; operation in stop3
- **SCI** — four full duplex non-return to zero (NRZ); LIN master extended break generation; LIN slave extended break detection; wakeup on active edge; SCI0 designed for AMR operation; TxD of SCI1 and SCI2 can be modulated with timers and RxD can be received through PRACMP;
- **SPI** — three full-duplex or single-wire bidirectional; double-buffered transmit and receive; master or slave mode; MSB-first or LSB-first shifting; SPI0 designed for AMR operation
- **IIC** — up to 100 kbps with maximum bus loading; multi-master operation; programmable slave address; interrupt driven byte-by-byte data transfer; supporting broadcast mode and 10-bit addressing; supporting SM BUS functionality; can wake from stop3
- **FTM** — 2-channel FTMs; selectable input capture, output compare, or buffered edge- or center-aligned PWM on each channel
- **IRTC** — independent real-time clock, independent power domain, 32 bytes RAM, 32.768 kHz input clock optional output to ICS, hardware calendar, hardware compensation due to crystal or temperature characteristics, tamper detection and indicator
- **PCRC** — 16/32 bit programmable cyclic redundancy check for high-speed CRC calculation
- **MTIM** — two 8-bit and one 16-bit timers; configurable clock inputs and interrupt generation on overflow
- **PDB** — programmable delay block; optimized for scheduling ADC conversions
- **PCNT** — position counter; working in stop3 mode without waking CPU; can be used to generate waveforms like timer

### Input/Output

- 57 GPIOs including one output-only pin
- Eight KBI interrupts with selectable polarity
- Hysteresis and configurable pullup device on all input pins; configurable slew rate and drive strength on all output pins.

### Package Options

- 80-pin LQFP, 64-pin LQFP

<sup>3</sup> PTA6 is an output-only pin when it is configured as GPIO.

<sup>4</sup> PTB2, PTB3 and PTB4 are compatible with 5 V devices with a pullup device.

## 3 Electrical Characteristics

### 3.1 Introduction

This section contains electrical and timing specifications for the MC9S08GW64 sries of microcontrollers available at the time of publication.

### 3.2 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

**Table 3. Parameter Classifications**

<b>P</b>	Those parameters are guaranteed during production testing on each individual device.
<b>C</b>	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
<b>T</b>	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
<b>D</b>	Those parameters are derived mainly from simulations.

#### NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

### 3.3 Absolute Maximum Ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in [Table 4](#) may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this section.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this

high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either  $V_{SS}$  or  $V_{DD}$ ) or the programmable pull-up resistor associated with the pin is enabled.

**Table 4. Absolute Maximum Ratings**

Rating	Symbol	Value	Unit
Supply voltage	$V_{DD}$	-0.3 to +3.8	V
Maximum current into $V_{DD}$	$I_{DD}$	120	mA
Digital input voltage	$V_{In}$	-0.3 to $V_{DD} + 0.3$	V
Instantaneous maximum current Single pin limit (applies to all port pins except PTA5 and PTB1) <sup>1, 2, 3</sup>	$I_D$	$\pm 25$	mA
Instantaneous maximum current Single pin limit (applies to PTA5 and PTB1) <sup>1, 2, 3</sup>	$I_D$	$\pm 50$	mA
Storage temperature range	$T_{stg}$	-55 to 150	°C

<sup>1</sup> Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive ( $V_{DD}$ ) and negative ( $V_{SS}$ ) clamp voltages, then use the larger of the two resistance values.

<sup>2</sup> All functional non-supply pins are internally clamped to  $V_{SS}$  and  $V_{DD}$ .

<sup>3</sup> Power supply must maintain regulation within operating  $V_{DD}$  range during instantaneous and operating maximum current conditions. If positive injection current ( $V_{In} > V_{DD}$ ) is greater than  $I_{DD}$ , the injection current may flow out of  $V_{DD}$  and could result in external power supply going out of regulation. Ensure external  $V_{DD}$  load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if the clock rate is very low (which would reduce overall power consumption).

### 3.4 Thermal Characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and voltage regulator circuits, and it is user-determined rather than being controlled by the MCU design. To take  $P_{I/O}$  into account in power calculations, determine the difference between actual pin voltage and  $V_{SS}$  or  $V_{DD}$  and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and  $V_{SS}$  or  $V_{DD}$  will be very small.

**Table 5. Thermal Characteristics**

Rating	Symbol	Value	Unit
Operating temperature range (packaged)	$T_A$	$T_L$ to $T_H$ -40 to 85	°C
Maximum junction temperature	$T_J$	95	°C
Thermal resistance Single-layer board			
80-pin LQFP	$\theta_{JA}$	TBD	°C/W
64-pin LQFP		TBD	
Thermal resistance Four-layer board			
80-pin LQFP	$\theta_{JA}$	TBD	°C/W
64-pin LQFP		TBD	

The average chip-junction temperature ( $T_J$ ) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad \text{Eqn. 1}$$

where:

$T_A$  = Ambient temperature, °C

$\theta_{JA}$  = Package thermal resistance, junction-to-ambient, °C/W

$P_D = P_{int} + P_{I/O}$

$P_{int} = I_{DD} \times V_{DD}$ , Watts — chip internal power

$P_{I/O}$  = Power dissipation on input and output pins — user determined

For most applications,  $P_{I/O} \ll P_{int}$  and can be neglected. An approximate relationship between  $P_D$  and  $T_J$  (if  $P_{I/O}$  is neglected) is:

$$P_D = K \div (T_J + 273^\circ\text{C}) \quad \text{Eqn. 2}$$

Solving Equation 1 and Equation 2 for K gives:

$$K = P_D \times (T_A + 273^\circ\text{C}) + \theta_{JA} \times (P_D)^2 \quad \text{Eqn. 3}$$

where K is a constant pertaining to the particular part. K can be determined from equation 3 by measuring  $P_D$  (at equilibrium) for a known  $T_A$ . Using this value of K, the values of  $P_D$  and  $T_J$  can be obtained by solving Equation 1 and Equation 2 iteratively for any value of  $T_A$ .

### 3.5 ESD Protection and Latch-Up Immunity

Although damage from electrostatic discharge (ESD) is much less common on these devices than on early CMOS circuits, normal handling precautions should be taken to avoid exposure to static discharge. Qualification tests are performed to ensure that these devices can withstand exposure to reasonable levels of static without suffering any permanent damage.

All ESD testing is in conformity with AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits. During the device qualification, ESD stresses were performed for the human body model (HBM), the machine model (MM) and the charge device model (CDM).

A device is defined as a failure if after exposure to ESD pulses the device no longer meets the device specification. Complete DC parametric and functional testing is performed per the applicable device specification at room temperature followed by hot temperature, unless instructed otherwise in the device specification.

**Table 6. ESD and Latch-up Test Conditions**

Model	Description	Symbol	Value	Unit
Human Body Model	Series resistance	R1	1500	Ω
	Storage capacitance	C	100	pF
	Number of pulses per pin	—	3	
Charge Device Model	Series resistance	R1	0	Ω
	Storage capacitance	C	200	pF
	Number of pulses per pin	—	3	
Latch-up	Minimum input voltage limit		-2.5	V
	Maximum input voltage limit		7.5	V

Table 7. ESD and Latch-Up Protection Characteristics

No.	Rating <sup>1</sup>	Symbol	Min	Max	Unit
1	Human body model (HBM)	$V_{HBM}$	$\pm 1500$	—	V
2	Machine Model (MM)	$V_{MM}$	$\pm 200$	—	V
3	Charge device model (CDM)	$V_{CDM}$	$\pm 500$	—	V
4	Latch-up current at $T_A = 85^\circ\text{C}$	$I_{LAT}$	$\pm 100$	—	mA

<sup>1</sup> Parameter is achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted.

### 3.6 DC Characteristics

This section includes information about power supply requirements and I/O pin characteristics.

- 2 Total leakage current is the sum value for all GPIO pins. This leakage current is not distributed evenly across all pins but characterization data shows that individual pin leakage current maximums are less than 250nA.
- 3 All functional non-supply pins, except for PTB2 are internally clamped to  $V_{SS}$  and  $V_{DD}$ .
- 4 Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.
- 5 Power supply must maintain regulation within operating  $V_{DD}$  range during instantaneous and operating maximum current conditions. If the positive injection current ( $V_{In} > V_{DD}$ ) is greater than  $I_{DD}$ , the injection current may flow out of  $V_{DD}$  and could result in external power supply going out of regulation. Ensure that external  $V_{DD}$  load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if clock rate is very low (which would reduce overall power consumption).
- 6 POR will occur below the minimum voltage.
- 7 Factory trimmed at  $V_{DD} = 3.0\text{ V}$ ,  $\text{Temp} = 25^\circ\text{C}$

11	C	Long term jitter of DCO output clock (averaged over 2-ms interval) <sup>3</sup>	$C_{Jitter}$	—	0.02	0.2	% $f_{dco}$

<sup>1</sup> Data in Typical column was characterized at 3.0 V, 25°C or is typical recommended value.

<sup>2</sup> This specification applies to any time the FLL reference source or reference divider is changed, trim value changed or changing from FLL disabled (FBELP, FBILP) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

<sup>3</sup> Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum  $f_{Bus}$ . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via  $V_{DD}$  and  $V_{SS}$  and variation in the crystal oscillator frequency increase the  $C_{Jitter}$  percentage for a given interval.

10	C	Voltage Regulator Recovery time	$t_{VRR}$	—	6	10	$\mu s$

- <sup>1</sup> Typical values are based on characterization data at  $V_{DD} = 3.0 V, 25^{\circ}C$  unless otherwise stated.
- <sup>2</sup> This is the shortest pulse that is guaranteed to be recognized as a reset pin request.
- <sup>3</sup> To enter BDM mode following a POR, BKGD/MS should be held low during the power-up and for a hold time of  $t_{MSH}$  after  $V_{DD}$  rises above  $V_{LVD}$ .
- <sup>4</sup> This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized.
- <sup>5</sup> Timing is shown with respect to 20%  $V_{DD}$  and 80%  $V_{DD}$  levels. Temperature range  $-40^{\circ}C$  to  $85^{\circ}C$ .
- <sup>6</sup> Except for LCD pins in Open Drain mode.

### 3.15 FLASH Specifications

This section provides details about program/erase times and program-erase endurance for the FLASH memory.

Program and erase operations do not require any special power sources other than the normal  $V_{DD}$  supply. For more detailed information about program/erase operations, see the Memory section.

Table 22. FLASH Characteristics

C	Characteristic	Symbol	Min	Typical	Max	Unit
D	Supply voltage for program/erase -40°C to 85°C	$V_{prog/erase}$	1.8		3.6	V
D	Supply voltage for read operation	$V_{Read}$	1.8		3.6	V

P	Mass erase time <sup>2</sup>	$t_{Mass}$		20,000		$t_{Fcyc}$
D	Byte program current <sup>3</sup>	$R_{IDDBP}$	—	4	—	mA
D	Page erase current <sup>3</sup>	$R_{IDPE}$	—	6	—	mA
C	Program/erase endurance <sup>4</sup> $T_L$ to $T_H = -40^\circ\text{C}$ to $+85^\circ\text{C}$ $T = 25^\circ\text{C}$		10,000	— 100,000	—	cycles
C	Data retention <sup>5</sup>	$t_{D\_ret}$	15	100	—	years

<sup>1</sup> The frequency of this clock is controlled by a software setting.

- <sup>2</sup> These values are hardware state machine controlled. User code does not need to count cycles. This information supplied for calculating approximate time to program and erase.
- <sup>3</sup> The program and erase currents are additional to the standard run  $I_{DD}$ . These values are measured at room temperatures with  $V_{DD} = 3.0$  V, bus frequency = 4.0 MHz.
- <sup>4</sup> Typical endurance for FLASH was evaluated for this product family on the 9S12Dx64. For additional information on how Freescale defines typical endurance, please refer to Engineering Bulletin EB619, *Typical Endurance for Nonvolatile Memory*.
- <sup>5</sup> Typical data retention values are based on intrinsic capability of the technology measured at high temperature and de-rated to 25°C using the Arrhenius equation. For additional information on how Freescale defines typical data retention, please refer to Engineering Bulletin EB618, *Typical Data Retention for Nonvolatile Memory*.
