All Rights Reserved.

Attention please!

As far as patents or other rights of third parties are concerned, liability is only assumed for components, not for applications, processes and circuits implemented within components or assemblies.

The information describes the type of component and shall not be considered as assured characteristics.

Terms of delivery and rights to change design reserved.

For questions on technology, delivery and prices please contact the Semiconductor Group Offices in Germany or the Siemens Companies and Representatives worldwide (see address list).

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Siemens Office, Semiconductor Group.

Siemens AG is an approved CECC manufacturer.

Packing

Please use the recycling operators known to you. We can also help you – get in touch with your nearest sales office. By agreement we will take packing material back, if it is sorted. You must bear the costs of transport.

For packing material that is returned to us unsorted or which we are not obliged to accept, we shall have to invoice you for any costs incurred.

Components used in life-support devices or systems must be expressly authorized for such purpose!

Critical components¹ of the Semiconductor Group of Siemens AG, may only be used in life-support devices or systems² with the express written approval of the Semiconductor Group of Siemens AG.

- 1 A critical component is a component used in a life-support device or system whose failure can reasonably be expected to cause the failure of that life-support device or system, or to affect its safety or effectiveness of that device or system.
- 2 Life support devices or systems are intended (a) to be implanted in the human body, or (b) to support and/or maintain and sustain human life. If they fail, it is reasonable to assume that the health of the user may be endangered.

Wichtige Hinweise!

Gewähr für die Freiheit von Rechten Dritter leisten wir nur für Bauelemente selbst, nicht für Anwendungen, Verfahren und für die in Bauelementen oder Baugruppen realisierten Schaltungen.

Mit den Angaben werden die Bauelemente spezifiziert, nicht Eigenschaften zugesichert.

Liefermöglichkeiten und technische Änderungen vorbehalten.

Fragen über Technik, Preise und Liefermöglichkeiten richten Sie bitte an den Ihnen nächstgelegenen Vertrieb Halbleiter in Deutschland oder an unsere Landesgesellschaften im Ausland.

Bauelemente können aufgrund technischer Erfordernisse Gefahrstoffe enthalten. Auskünfte darüber bitten wir unter Angabe des betreffenden Typs ebenfalls über den Vertrieb Halbleiter einzuholen.

Die Siemens AG ist ein Hersteller von CECC-qualifizierten Produkten.

Verpackung

Bitte benutzen Sie die Ihnen bekannten Verwerter. Wir helfen Ihnen auch weiter – wenden Sie sich an Ihren für Sie zuständigen Vertrieb Halbleiter. Nach Rücksprache nehmen wir Verpackungsmaterial sortiert zurück. Die Transportkosten müssen Sie tragen.

Für Verpackungsmaterial, das unsortiert an uns zurückgeliefert wird oder für das wir keine Rücknahmepflicht haben, müssen wir Ihnen die anfallenden Kosten in Rechnung stellen.

Bausteine in lebenserhaltenden Geräten oder Systemen müssen ausdrücklich dafür zugelassen sein!

Kritische Bauelemente¹ des Bereichs Halbleiter der Siemens AG dürfen nur mit ausdrücklicher schriftlicher Genehmigung des Bereichs Halbleiter der Siemens AG in lebenserhaltenden Geräten oder Systemen² eingesetzt werden.

- 1 Ein kritisches Bauelement ist ein in einem lebenserhaltenden Gerät oder System eingesetztes Bauelement, bei dessen Ausfall berechtigter Grund zur Annahme besteht, daß das lebenserhaltende Gerät oder System ausfällt bzw. dessen Sicherheit oder Wirksamkeit beeinträchtigt wird.
- 2 Lebenserhaltende Geräte und Systeme sind (a) zur chirurgischen Einpflanzung in den menschlichen Körper gedacht, oder (b) unterstützen bzw. erhalten das menschliche Leben. Sollten sie ausfallen, besteht berechtigter Grund zur Annahme, daß die Gesundheit des Anwenders gefährdet werden kann.

1 Overview

1.1 Functional Description, Benefits

- New B6HF bipolar technology, 25GHz f_T
- Small outline P-TSSOP 16 package
- Reduced external components
- Frequency range up to 3.0GHz
- Amplifier may be used as LNA or Driver
- LNA mode
 - 1.7dB typ. noise figure at 1.8GHz
 - 5mA typ. current consumption
- Driver mode
 - +12dBm output at 1dB compression
 - 20mA current consumption
- Gilbert cell mixer with high gain
- 2.7 - 4.5V voltage supply
- -40°C to +85°C operational temperature range
- Standby function
- High isolation values for amplifier and mixer
- Good crosstalk performance

1.2 Applications

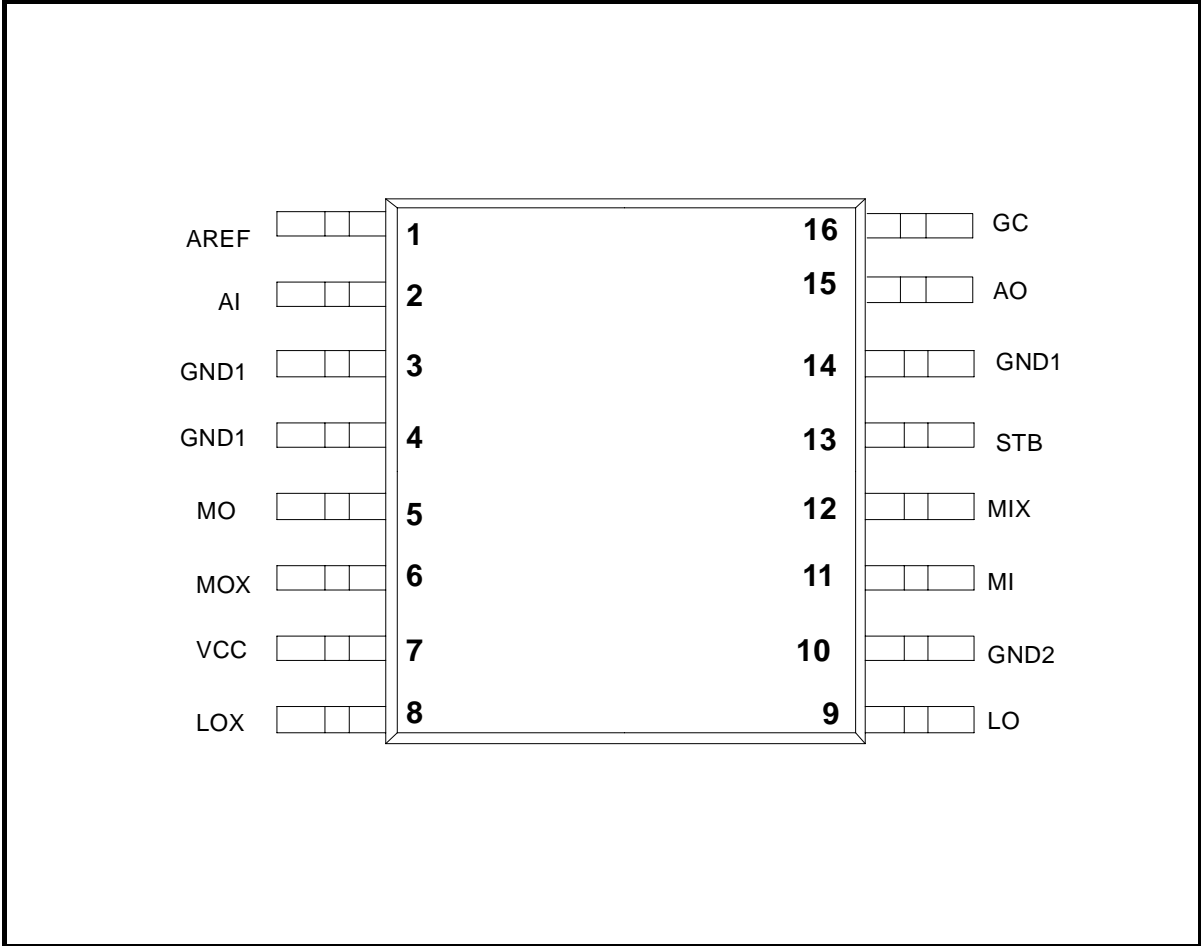

- Cellular radio systems
- Cordless telephone systems
- WLAN-Systems

1.4 Pin Definitions and Functions

Pin No.	Symbol	Function
1	AREF	Amplifier bias supply for signal input
2	AI	Amplifier signal base input
3	GND1	Amplifier ground
4	GND1	Amplifier ground
5	MO	Mixer signal open collector output
6	MOX	Mixer signal open collector output
7	VCC	Voltage supply total circuit
8	LOX	Mixer local oscillator signal base input, inverted
9	LO	Mixer local oscillator signal base input, not inverted
10	GND2	Mixer ground
11	MI	Mixer signal emitter input, not inverted
12	MIX	Mixer signal emitter input, inverted
13	STB	Standby mixer and bandgap
14	GND1	Amplifier ground
15	AO	Amplifier signal open collector output
16	GC	Amplifier gain control

1.5 Functional Block Diagram

1.6 Circuit Description

MIXER

The mixer used in this design is a general purpose up-/down conversion gilbert cell mixer. Via the pins MI/MIX the RF enters the IC. Using an external supplied local oscillator at LO/LOX a converted output signal is created at the open collector output pins MO/MOX. The open collector pins need to be connected to an external voltage supply. The RF connection to the mixer inputs can be single ended or balanced, capacitive or inductive. To improve the mixer performance external resistors at MI/MIX make it possible to adjust the mixer current. Voltage supply for the mixer has to be connected to the pin VCC and to GND2.

AMPLIFIER

The amplifier may be used as a low noise amplifier LNA or as a driver. At pin AI the RF signal enters the IC, at the open collector output AO, which need to be connected to supply voltage, the amplified signal is external available for further use. Matching networks at in-/and output can be used for improving the gain and the noise performance. To reduce the series feedback of the emitter line the amplifier is connected to ground via three GND1 pins. At AREF a internal supplied reference voltage is available for the DC biasing of AI. This dc output should be implemented in an input matching network. The voltage supply for the amplifier is also VCC. The dc-level at the pin GC allows to adjust the amplifier current.

Lower current is recommended for using the amplifier as an LNA, high current for using it as a driver.

COMMON

Differential signals and symmetrical circuits are used throughout the mixer part of the IC. An internal bias driver generates supply voltage and temperature compensated reference voltages. The STB pin allows the mixer and bandgap part of the IC to be switched in a low power mode.

All pins with the exception of GND1,2 and AI/AO are ESD protected.

2 Electrical Characteristics

2.1 Absolute Maximum Ratings

The maximum ratings may not be exceeded under any circumstances, not even momentarily and individually, as permanent damage to the IC will result.

Ambient temperature $T_{amb} = -40^{\circ}\text{C} \dots +85^{\circ}\text{C}$

#	Parameter	Symbol	Limit Values		Units	Remarks
			Min	Max		
1	Supply Voltage	V_S	-0.3	5.0	V	
2a	Input Voltage	$V_{MI/MIX}$	-0.3	1.9	V	$V_S = 0$
2b	Input Voltage	$V_{LO/LOX}$	0.6	$V_S+0.3$ 5.0max.	V V	
2c	Input Voltage	V_{AI}	-0.3	$V_{AO}+0.3$ 3.5max.	V V	
2d	Input Voltage (AC Peak)	V_{AI}	-2		V	Freq.>1MHz $I_{AI} < nA$
2e	Input Voltage	V_{GC}	-0.3	$V_S+0.3$ 2.7max.	V V	
2f	Input Voltage	V_{STB}	-0.3	$V_S+0.3$ 5.0max.	V V	
3a	Output Voltage	V_{AREF}	-0.3	2.0	V	
3b	Open Collector Output Voltage	$V_{MO/MOX}$	1.7	$V_S+0.3$ 5.0max.	V V	
3c	Open Collector Output Voltage	V_{AO}	-0.3	3.5	V	Base open
3d	Open Collector Output Voltage	V_{AO}	-0.3	7.0	V	$R_B < 50k\Omega$
4a	Amplifier Current (Collector)	I_{AO}		30	mA	
4b	Amplifier Current (Base, Peak)	I_{AI}		6.0	mA	DC and AC
4c	Amplifier Power Dissipation	P_{AMPtot}		105	mW	
5	Differential Input Voltage	V_{DIFF}		2.0	V_{PP}	
6	Junction Temperature	T_j		125	$^{\circ}\text{C}$	

Absolute Maximum Ratings

The maximum ratings may not be exceeded under any circumstances, not even momentarily and individually, as permanent damage to the IC will result.

Ambient temperature $T_{amb} = -40^{\circ}\text{C} \dots +85^{\circ}\text{C}$

#	Parameter	Symbol	Limit Values		Units	Remarks
			Min	Max		
7	Storage Temperature	T_S	-40	125	$^{\circ}\text{C}$	
8a	Thermal Resistance	R_{thJA}		213	K/W	1)
8b	Thermal Resistance	R_{thSO}		160	K/W	2)
9	ESD integrity, all pins without AI, AO and GND1/2	V_{ESD}	-500	500	V	3)

1) Attention: **Do not exceed the max. junction temperature**

2) Junction to soldering point, simulated with FEM

3) HBM according MIL STD 883D, method 3015.7, and EOS/ESD assn. standard S5.1-1993

2.2 Operational Range

Within the operational range the IC operates as described in the circuit description. The AC/DC characteristic limits are not guaranteed.

Supply voltage $V_{VCC} = 2.7V...4.5V$, Ambient temperature $T_{amb} = -40^{\circ}C...85^{\circ}C$

#	Parameter	Symbol	Limit Values		Units	Remarks
			Min	Max		
1	AI Input Frequency	f_{AI}		3000	MHz	
2	MI/X Input Frequency	f_{MI}		3000	MHz	
3	LO/X Input Frequency	f_{LO}		3000	MHz	
4	IF Intermediate Frequency	f_{IF}		3000	MHz	
5	Standby Voltage On	STB_{ON}	2.0	V_S	V	
6	Standby Voltage Off	STB_{OFF}	0	0.5	V	
7	Gain Control Voltage, High	GC_{High}	2.0	2.7	V	Diagram 5
8	Gain Control Voltage, Low	GC_{Low}	0	0.6	V	Diagram 5

Note: Power levels refer to 50 Ohms impedance

2.3 AC/DC Characteristics

AC/DC characteristics involve the spread of values guaranteed within the specified supply voltage and ambient temperature range. Typical characteristics are the median of the production.

Supply voltage $V_{VCC} = 2.7V \dots 4.5V$, Ambient temperature $T_{amb} = +25^{\circ}C$

#	Parameter	Symbol	Limit Values			Units	Test Conditions	Test Circuit
			Min	Typ	Max			

Supply Current

1a	Supply current, total IC	$I_{5,6,7,15}$		23.6		mA	STB ON, no external resistors at MI/MIX*	1, $I_{AO}=20$ mA
1b	Supply current, total IC	$I_{5,6,7,15}$		1.6		mA	STB ON, no external resistors at MI/MIX*	1, $I_{AO}=0$ mA
2	Supply current, total IC	$I_{5,6,7,15}$		<20		μA	STB OFF, GC=0V	1

* Minimum value for external resistors at MI/MIX: $R1=R2=330\Omega$

AC/DC Characteristics

AC/DC characteristics involve the spread of values guaranteed within the specified supply voltage and ambient temperature range. Typical characteristics are the median of the production.

Supply voltage $V_{VCC} = 2.7V$ to $4.5V$, Ambient temperature $T_{amb} = +25^{\circ}$

Test Circuit 3

**S-Parameter Measurement of Amplifier
S11, S12, S21, S22**

The S-Parameters are tested at the indicated frequency on Duroid 5880 Teflon Boards.

Via the NWA the capacitive coupling is done.
The output levels at port1 and 2 for pin x and y are -30dbm.

S11 and S22 have to be considered as design hints and are measured with SIEMENS testboards.

Test	Test frequency MHz	Pin X	Pin Y
Amp.S11, S12, S21, S22	30 - 3000	AI	AO

Test Circuit 4

**S-Parameter Measurement of Mixer
S11, S12, S21, S22**

Test	Test Frequency [MHz]	Pin X	Pin Y
LO-Input impedance	30 - 3000	8	9
Mi-Input impedance	30 - 3000	11	12
MO-Output impedance	30 - 3000	5	6

The S-Parameters are tested at the indicated frequency and the equivalent parallel or series circuit is calculated on this base.

Via the NWA the capacitive coupling is done and the open collector pins are connected to VCC. The output levels at port1 and 2 for pin x and y are -30dbm for MI and MO-impedances and -5dbm for the LO impedance. S-Parameters have to be considered as design hints and are measured with SIEMENS testboards.

3.1.3 Application hint - Mixer metrics versus mixer current

Mixer current may be increased to obtain a higher Input 3rd Order Intercept (IIP3), higher 1 dB Compression Point (P1dB), and increased Conversion Gain (G). In a typical application, in order to increase mixer current from the minimum level of 800µA, R5 and R6 are added as shown in the circuit diagram at the end of this section. These external resistors are placed in parallel to existing bias resistors internal to the PMB2333, thereby reducing the aggregate resistance in the emitters and increasing current. As current is increased by further reduction of the value of R5 and R6, the mixer inputs MI and MIX may begin to suffer ‘RF Loading’ unless RF chokes are used between the MI/MIX pins and R5 / R6 (compare test circuit 1).

For the data presented in this section, mixer current was varied in a different manner. To eliminate the effects of RF impedance variation (due to ‘RF Loading’) at MI / MIX caused by changing the values of R5 and R6 for different mixer currents, these resistors were set equal to 1kΩ. Mixer current was then varied by adjusting the power supply voltage Vx. Note that Vx may take on positive values with respect to ground for low (e.g. 1mA) mixer currents, or negative values for higher currents.

Figure 9: Modified mixer input circuitry

Note that the mixer input impedance seen at MI / MIX is a strong function of mixer current. The mixer input balanced-to-unbalanced transformer/matching circuitry was originally tuned for a current of 4mA, and was **not** re-optimized for each of the other current levels. Despite this limitation, the return loss at the 50Ω port is better than 10dB over the entire 1 to 10 mA current range. The mixer output (MO / MOX) and local oscillator (LO / LOX) ports exhibit negligible change in impedance over this same current range.

Measurement conditions: $T_A = 25\text{ °C}$
 $V_{CC} = 2.7\text{ V and } 4.5\text{V}$
 $f_{RF} = 1960\text{ MHz}$
 $f_{LO} = 1735\text{ MHz, } P_{LO} = -6\text{ dBm}$

The Effect of Power Supply Voltage on Mixer Metrics

In seeking to improve Mixer Input Third-Order Intercept and 1dB Compression Point, it is important to understand the constraints on these parameters imposed by power supply voltage. **Refer to Figure 10.**

Receiver 'Blocking' is predominantly influenced by the Mixer's 1 dB Compression Point (P1dB) and **not** the Input 3rd Order Intercept Point (IIP3). For a supply voltage of 4.5V, mixer P1dB (referred to the input of the application circuitry) increases with additional mixer current, and begins to flatten out above 8mA. When supply voltage is decreased to 2.7V, mixer P1dB starts flattening out at around 5mA.

Note how, at the 2.7V supply voltage, IIP3 continues to increase at currents over 6mA while P1dB flattens out. For a given conversion gain G, while operating at 2.7 Volts, considering only the mixer's Input 3rd Order Intercept (IIP3) might lead one to falsely conclude that increasing current beyond 6mA improves receiver blocking. If, however, conversion gain is decreased, it may be possible to improve the receiver's blocking level with additional mixer current.

As shown in Figure 10, the 1 dB compression level, referred to the input, is limited by either current or the available voltage swing at the mixer output. The transition between these two regions takes place at 4mA for the specified conversion gain and supply voltage.

Figure 11 gives the DSB mixer noise figure versus the mixer current.

Figure 10: Mixer Input Intercept Point (IIP3), 1 dB Compression Point (P1dB) Referred to Input, Gain (G).

3.3 Receiver/SAW Application

3.3.1 Shortform Data

Measurement conditions

Ambient temperature $T_A = 25\text{ °C}$

Supply voltage $V_S = 3.6\text{ V}$

LNA and Mixer input signal $f_{RF} = 890\text{ MHz}$, $P_{RF} = -40\text{ dBm}$

LO signal $f_{LO} = 972\text{ MHz}$, $P_{LO} = -6\text{ dBm}$

IF output $f_{IF} = 82\text{ MHz}$

All measurements refer to SMA connectors without consideration of PCB losses

The figures in the mixer section are calculated from a measurement SAW filter + mixer assuming an insertion loss of 3.1dB for the filter at measurement frequency (890MHz).

Parameter	Symbol	typ. Value	Unit	Remarks
Mixer section				
Mixer current	I_{Mixer}	10	mA	$I_{MO}+I_{MOX}$
Conversion gain	G_C	4.5	dB	
Noise Figure (SSB)	NF_{SSB}	12	dB	
3rd order input intercept point	$IICP3$	+6.5	dBm	
input 1dB-compression point	P_{1dB}	-3	dBm	
LNA section				
LNA current	I_{LNA}	17	mA	
Gain	G_{LNA}	20	dB	
Noise Figure	NF	1.75	dB	
3rd order input intercept point	$IICP3$	0	dBm	
input 1dB-compression point	P_{1dB}	-11	dBm	
AI return loss	$ S_{11, AI} $	14	dB	
AO return loss	$ S_{11, AO} $	15	dB	

Measurement conditions

Ambient temperature $T_A = 25\text{ °C}$

Supply voltage $V_S = 3.6\text{ V}$

LNA and Mixer input signal $f_{RF} = 890\text{ MHz}$, $P_{RF} = -40\text{ dBm}$

LO signal $f_{LO} = 972\text{ MHz}$, $P_{LO} = -6\text{ dBm}$

IF output $f_{IF} = 82\text{ MHz}$

All measurements refer to SMA connectors without consideration of PCB losses

The figures in the mixer section are calculated from a measurement SAW filter + mixer assuming an insertion loss of 3.1dB for the filter at measurement frequency (890MHz).

Parameter	Symbol	typ. Value	Unit	Remarks
Cascade figures				
LNA, resistive 3.1 dB pad (see schematic), SAW filter, mixer				
Cascade Gain	G	18	dB	
Cascade Noise Figure (SSB)	NF	3.35	dB	
3rd order input intercept point	IICP3	-8	dBm	
input 1dB-compression point	P_{1dB}	-17	dBm	

3.3.2 System calculations

Due to the use of a SAW filter for mixer input matching and balancing an isolated measurement of the mixer figures is not possible. The following system calculations have valid entries only for the Gain, IP3, and Noise Figure. The input values are either from extra measurements (e.g. SAW filter insertion loss) or adjusted to give a cascade figure that can be measured (e.g. filter+mixer IP3). All non-fat typeface figures have no meaning.
