

■ General Description

The AME8852A family of positive, CMOS linear regulators provide low dropout voltage(110mV@150mA), low quiescent current, and low noise CMOS LDO. These rugged devices have both Thermal Shutdown, and Current limit to prevent device failure under the "Worst" of operating conditions.

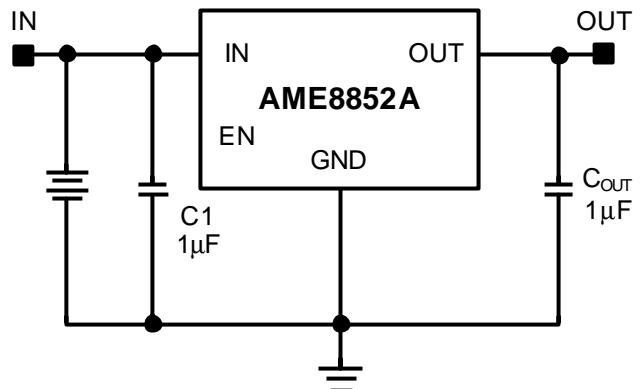

■ Features

- Low Dropout Voltage: 110mV@150mA
- Guaranteed Current: 150mA
- Quiescent Current: 60 μ A (typ.)
- Over-Temperature Shutdown
- Current Limiting protection
- PSRR: 60dB@10KHz
- Ultra-Low-Noise: 100 μ V_{RMS} at 1Hz to 100KHz
- Low Temperature Coefficient
- Input Voltage Range: 2.5V~5.5V
- Output Voltage Range: 0.8V~4.3V
- Green Products Meet RoHS Standards

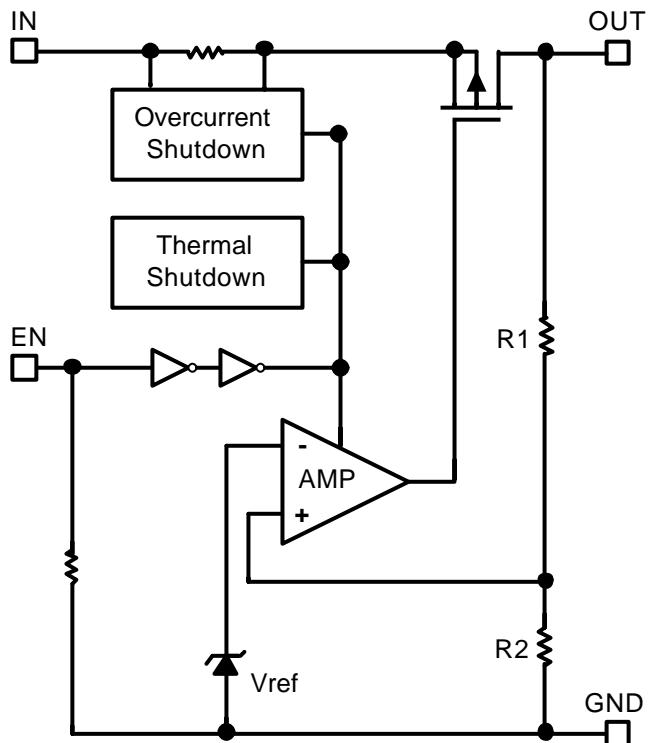

■ Applications

- Instrumentation
- Portable Electronics
- Wireless Devices
- Cordless Phones
- PC Peripherals
- Battery Powered Widgets

AME8852A

High PSRR, Low Noise, 150mA CMOS Regulator

■ Detailed Description

The AME8852A family of CMOS regulators contain a PMOS pass transistor, voltage reference, error amplifier, over-current protection, thermal shutdown, and Power Good detection circuitry.

The P-channel pass transistor receives data from the error amplifier, over-current shutdown, and thermal protection circuits. During normal operation, the error amplifier compares the output voltage to a precision reference. Over-current and Thermal shutdown circuits become active when the junction temperature exceeds 150°C, or the current exceeds 150mA. During thermal shutdown, the output voltage remains low. Normal operation is restored when the junction temperature drops more 20°C.

Capacitor Selection and Regulator Stability

The AME8852A is stable with an output capacitor to ground of 1 μ F or greater. Ceramic capacitors have the lowest ESR, and will offer the best AC performance. Conversely, Aluminum Electrolytic capacitors exhibit the highest ESR, resulting in the poorest AC response. Unfortunately, large value ceramic capacitors are comparatively expensive. One option is to parallel a 0.1 μ F ceramic capacitor with a 10 μ F Aluminum Electrolytic. The benefit is low ESR, high capacitance, and low overall cost.

A second capacitor is recommended between the input and ground to stabilize V_{IN} . The input capacitor should be at least 0.1 μ F to have a beneficial effect.

Enable Pin

The Enable Pin is pull-low. When activated pulled low, the MOS pass transistor shuts off, and all internal circuits are powered down. In this state, the stand by current is than 1 μ A.

Capacitor Selection and Regulator Stability

The maximum output power of the AME8852 is limited by the maximum power dissipation of the package. By calculation the power dissipation of the package as a function of the input voltage, output voltage and output current, the maximum input voltage can be obtained. The maximum power dissipation should not exceed the package's maximum power rating.

$$P_{MAX} = (V_{IN(MAX)} - V_{OUT}) \times I_{OUT}$$

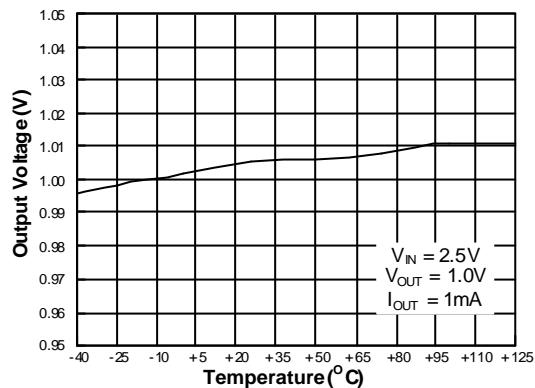

Where:

$V_{IN(MAX)}$ = maximum input voltage

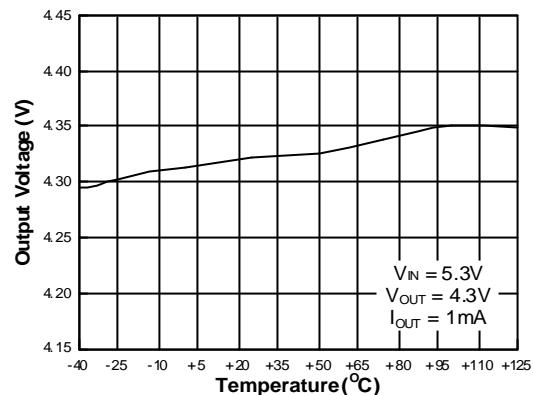

P_{MAX} = maximum power dissipation of the package
