

Low Dropout 600mA Fixed Voltage Linear Regulator

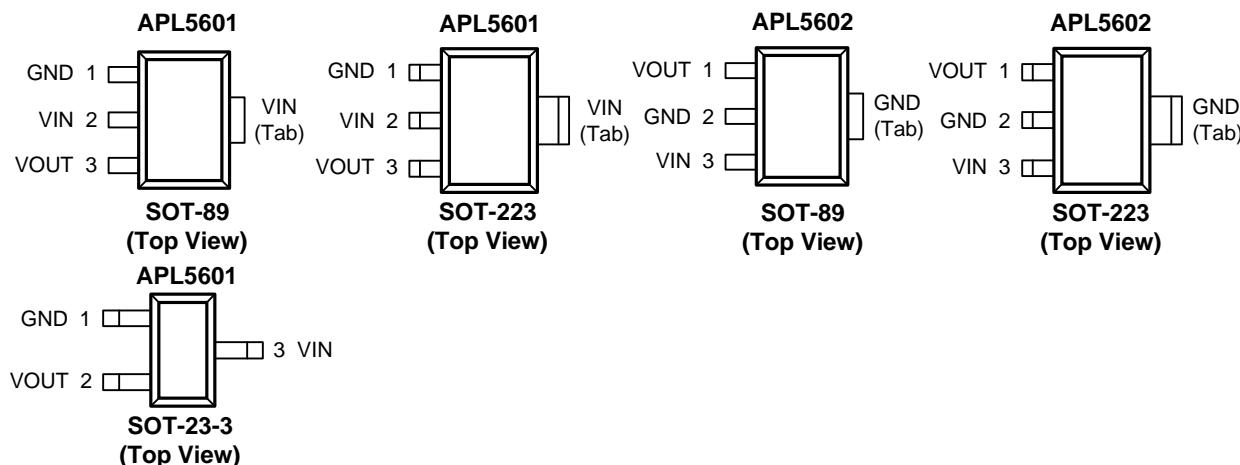

Features

- **Low Dropout Voltage: 220mV (Typical) @600mA**
- **Wide Input Voltage from 2.9V~6.5V**
- **Low Quiescent Current: 140mA**
- **Output Voltage Range : 1~5V**
- **Fixed Output Voltage with 2% Accuracy**
- **Stable with a Low ESR, 2.2nF Output Capacitance**
- **Short Circuit Current-Limit**
- **Over-Temperature Protection**
- **Current-Limit Protection**
- **Internal Soft-Start**
- **SOT-23-3, SOT-89, and SOT-223 Packages**
- **Lead Free and Green Devices Available (RoHS Compliant)**

Applications

- CD/DVD-ROM, CD-R/W
- Networking System, LAN Card, ADSL/Cable Modem
- Set-Top Box
- PC Peripherals
- Battery-Powered System

Pin Configuration

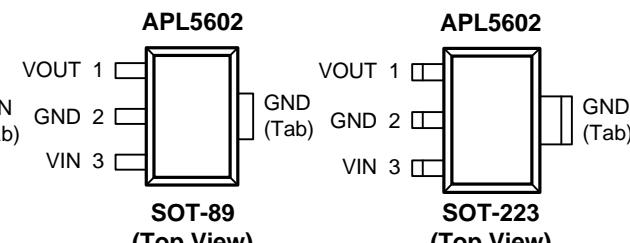

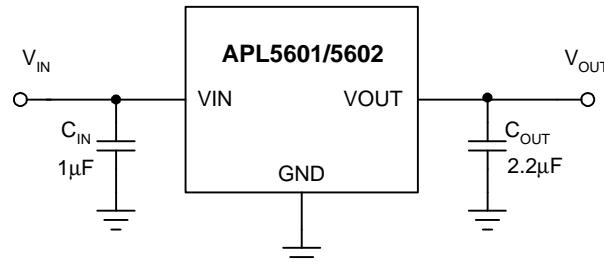

ANPEC reserves the right to make changes to improve reliability or manufacturability without notice, and advise customers to obtain the latest version of relevant information to verify before placing orders.

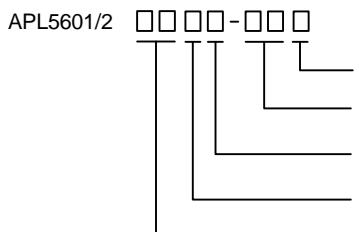

General Description

The APL5601/5602 family of low-power and low dropout linear regulators which operate from 2.9V to 6.5V input voltage and deliver up to 600mA output current. Typical dropout voltage is only 220mV (typical) at 600mA output. The APL5601/5602 regulators with low 140µA quiescent current are ideal for battery-powered system appliances. The APL5601/5602 regulators are stable with a 2.2µF ceramic capacitor. The features of current-limit, short circuit current-limit, and over-temperature protection protect the device against currnet over loads and overtemperature. The APL5601/5602 regulators come in SOT-23-3, SOT-89, and SOT-223 packages.

Simplified Application Circuit

Ordering and Marking Information

	Package Code A : SOT-23-3 D : SOT-89 V : SOT-223	
	Operating Ambient Temperature Range I : -40 to 85 °C H : -40 to 125°C	
	Handling Code TR : Tape & Reel	
	Assembly Material G : Halogen and Lead Free Device	
APL5601/2 D/V:	APL5601 XXXXX VV	XXXXX - Date Code VV - Voltage Code

Note: ANPEC lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS. ANPEC lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J-STD-020D for MSL classification at lead-free peak reflow temperature. ANPEC defines "Green" to mean lead-free (RoHS compliant) and halogen free (Br or Cl does not exceed 900ppm by weight in homogeneous material and total of Br and Cl does not exceed 1500ppm by weight).

Note 1: For other voltage versions please contact ANPEC for details.

Marking for SOT-23-3

Product Name	Marking
APL5601-10A	61aX
APL5601-12A	615X
APL5601-15A	619X
APL5601-18A	61CX
APL5601-25A	61JX
APL5601-28A	61MX
APL5601-30A	61OX
APL5601-31A	61PX
APL5601-33A	61RX
APL5601-48A	61XX
APL5601-50A	61ZX

Note: The last character in the Marking, "X", refers to date code.

Absolute Maximum Ratings (Note 2)

Symbol	Parameter	Rating	Unit
V_{IN}	VIN Supply Voltage (VIN to GND)	-0.3 to 7	V
V_{OUT}	Output Voltage (VOUT to GND)	-0.3 to $V_{IN}+0.3$	V
P_D	Power Dissipation	Internally Limited	
T_J	Maximum Junction Temperature	150	°C
T_{STG}	Storage Temperature Range	-65 to 150	°C
T_{SDR}	Maximum Lead Soldering Temperature, 10 Seconds	260	°C

Note 2: Stresses beyond the absolute maximum rating may damage the device and exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Thermal Characteristics (Note 3, 4)

Symbol	Parameter	Typical Value			Unit
θ_{JA}	Junction to Air Thermal Resistance	SOT-23-3	260		$^{\circ}\text{C/W}$
		SOT-89	180		
		SOT-223	135		
θ_{JC}	Junction to Case Thermal Resistance	SOT-23-3	130		$^{\circ}\text{C/W}$
		SOT-89	40		
		SOT-223	15		

Note 3: At elevated temperatures, device power dissipation must be derated based on package thermal resistance and heatsink values. The junction-to-ambient thermal resistance is measured on a PC board mounting with the device soldered down to minimum copper area. If power dissipation causes the junction temperature to exceed specified limits, the device will go into thermal shutdown.

Note 4: The maximum allowable power dissipation at any T_A (ambient temperature) is calculated using: $P_D(\text{max}) = (T_J - T_A) / \theta_{JA}$; $T_J = 125^{\circ}\text{C}$. Exceeding the maximum allowable power dissipation will result in excessive die temperature.

Recommended Operating Conditions

Symbol	Parameter	Range			Unit
V_{IN}	VIN Supply Voltage	2.9 to 6.5V			V
I_{OUT}	Output Current	0 to 0.6			A
C_{IN}	Input Capacitor	0.82 to 470			μF
C_{OUT}	Output Capacitor	1 to 330			μF
T_J	Junction Temperature	-40 to 125			$^{\circ}\text{C}$
T_A	Ambient Temperature (Temperature Code:I)	-40 to 85			$^{\circ}\text{C}$
	Ambient Temperature (Temperature Code:H)	-40 to 125			$^{\circ}\text{C}$

Electrical Characteristics

Refer to the typical application circuit. $V_{IN} = V_{OUT} + 1\text{V}$ or (Minimum $V_{IN}=2.9\text{V}$), $I_{OUT} = 1\text{mA}$, $T_A = -40$ to 85°C , unless otherwise specified. Typical values are at $T_A = 25^{\circ}\text{C}$.

Pin Description

PIN		FUNCTION
NO.	NAME	
1	VIN	Input Supply Pin. Supply voltage can range from 2.9V to 6.5V. Bypass with a 1μF capacitor to the GND
2	VOUT	Regulator Output. Sources up to 600mA. A small capacitor is needed from this pin to ground to assure stability.
3	GND	Ground.

Block Diagram

Typical Application Circuit

Function Description

Under Voltage Lockout (UVLO)

The APL5601/5602 regulators have built-in under-voltage lock-out circuits to keep the output shutting off until internal circuitry is operating properly. The UVLO function initiates a soft-start process after input voltage exceeds its rising UVLO threshold during power on. Typical UVLO threshold is 2.5V with 0.15V hysteresis.

Soft-Start

The APL5601/5602 provide an internal soft-start circuitry to control rise rate of the output voltage and limit the current surge during start-up. Approximate 20 μ s delay time after the V_{IN} is over the UVLO threshold, the output voltage starts the soft-start. The typical soft-start interval is about 130 μ s.

Current-Limit

The APL5601/5602 provides a current-limit circuitry, which monitors and controls P-MOS's gate voltage, limiting the output current to 700mA. For reliable operation, the device should not be operated in current-limit for extended period.

Short Circuit Current-Limit

When the output voltage drops below 0.6V, which is caused by the over load or short circuit, the internal short circuit current-limit circuitry limits the output current down to 250mA. The short circuit current-limit is used to reduce the power dissipation during short circuit condition. In some high V_{IN} - V_{OUT} conditions, if the junction temperature is over the thermal shutdown temperature, the device will enter the thermal shutdown. Please refer to the section on thermal considerations for power dissipation calculations. The short circuit current-limit has a blanking time feature after the UVLO threshold is reached, so that it will avoid the output causing short circuit current-limit protection during start-up; the blanking time is about 600 μ s.

Thermal Shutdown

A thermal shutdown circuit limits the junction temperature of APL5601/5602. When the junction temperature exceeds +150°C, the thermal shutdown circuitry disables the output, allowing the device to cool down. The output circuitry is enabled again after the junction temperature cools down by 40°C, resulting in a pulsed output during continuous thermal overload conditions. Thermal protection is designed to protect the IC in the event of over temperature conditions. For reliable operation, the junction temperature cannot exceed $T_J=+125^{\circ}\text{C}$.

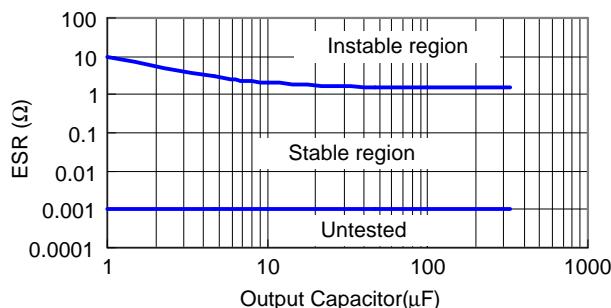

Application Information

Input Capacitor

The APL5601/5602 require proper input capacitors to supply surge current during stepping load transients to prevent the input rail from dropping. Because the parasitic inductor from the voltage sources or other bulk capacitors to the VIN limits the slew rate of the surge current, it is necessary to place the input capacitors near VIN as close as possible. Input capacitors should be larger than $0.82\mu F$.

Output Capacitor

The APL5601/5602 need a proper output capacitor to maintain circuit stability and to improve transient response over temperature and current. In order to insure the circuit stability, the proper output capacitor value should be larger than $1\mu F$. With X5R and X7R dielectrics, $2.2\mu F$ is sufficient at all operating temperatures. Maximum output capacitor should be less than $330\mu F$ to insure the system can be powered on successfully.

Operation Region and Power Dissipation

The APL5601/5602 maximum power dissipation depends on the thermal resistance and temperature difference between the die junction and ambient air. The power dissipation P_D across the device is:

$$P_D = (T_J - T_A) / \theta_{JA}$$

where $(T_J - T_A)$ is the temperature difference between the junction and ambient air. θ_{JA} is the thermal resistance between junction and ambient air. Assuming the $T_A = 25^\circ C$, maximum $T_J = 150^\circ C$ (typical thermal limit threshold) and $\theta_{JA} = 260^\circ C/W$ (SOT-23-3), so the maximum power dissipation is calculated as:

$$\begin{aligned} P_{D(max)} &= (150-25)/260 \\ &= 0.48(W) \end{aligned}$$

For normal operation, do not exceed the maximum operating junction temperature of $T_J = 125^\circ C$. The calculated power dissipation should be less than:

$$\begin{aligned} P_D &= (125-25)/260 \\ &= 0.38(W) \end{aligned}$$

The pin 3 of the SOT-23 and the tabs (and pin 2) of the SOT-89 and SOT-223 provide an electrical connections and channel heat away. Connect the pins and tabs to a large area copper plane on PCBs for better heat dissipation.

Layout Consideration

Figure 1 illustrates the layout. Below is a checklist for your layout:

1. Please place the input capacitors close to the VIN.
2. Ceramic capacitors for load must be placed near the load as close as possible.
3. To place APL5601/5602 and output capacitors near the load is good for performance.
4. Large current paths, the bold lines in figure 1, must have wide tracks.

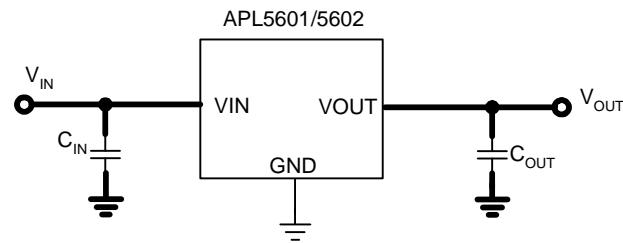

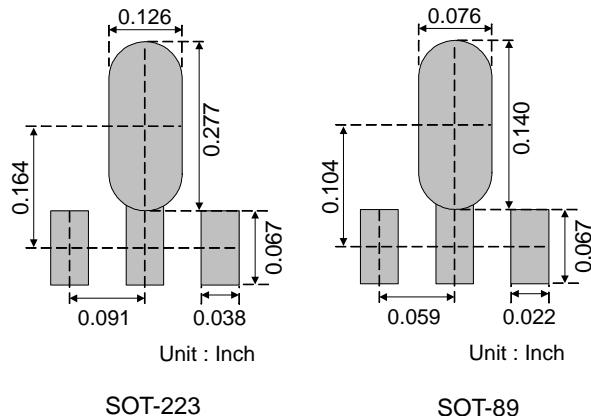

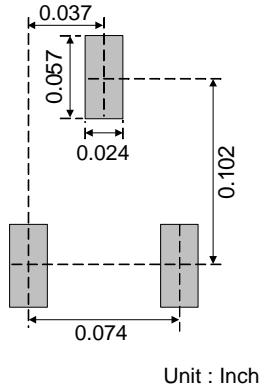

Figure 1.
