

Arbitrary Waveform Generators

AWG5000 Series Data Sheet

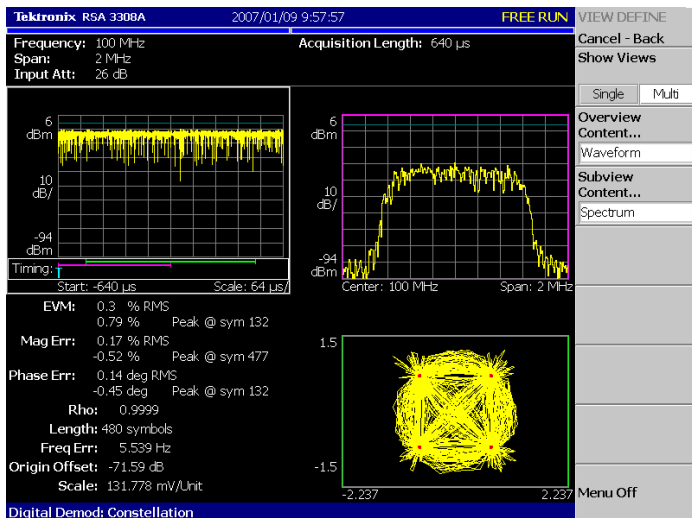

Features & Benefits

- 480 MHz Carrier, High Dynamic Range RF Signals
- High Dynamic Range IF Signals with Up to 180 MHz Modulation Bandwidth
 - 180 MHz Modulation Bandwidth with -58 dBc SFDR
- Only Stand-alone AWG with 4 Channels Simplifies Test Setup and Reduces Uncertainty
- RFXpress Software enables Quick Creation of Digitally Modulated and Radar Signals
- Waveform Sequencing and Subsequencing
 - Enables Creation of Infinite Waveform Loops, Jumps, and Conditional Branches
 - Enhance the Ability to Replicate Real-world Signal Behavior
- Dynamic Jump Capability
 - Enables the Creation of Complex Waveforms that Respond to Changing External Environment

- 2 or 4 Differential/Single-ended Outputs provide Testing Flexibility
- Up to 8 Marker Outputs ideal for System Synchronization
- 28 Digital Output Channels Create Highly Precise Digital Signals
- Deep Memory enables the Creation of Long Complex Waveform Sequences
- Playback of Signals Captured on Scopes and Real-time Spectrum Analyzers allows for Simulation of Real-world Environments
- Down to 800 ps Resolution Edge Timing Shift Control
- 8,000 Steps Real-time Sequencing Creates Infinite Waveform Loops, Jumps, and Conditional Branches
- Easy to Use and Learn, Shortens Test Time
- Convenient Benchtop Form Factor
- Integrated PC supports Network Integration and provides a Built-in DVD, Removable Hard Drive, LAN, and USB Ports

Applications

- High-resolution Wireless Communications and Defense Electronics
- Education and Research
- ADC/DAC Testing
- Mixed-signal Design and Test
- Real-world, Ideal, or Distorted Signal Generation – Including all the Glitches, Anomalies, and Impairments
- System Synchronization and Timing Control for Large-scale Test Systems

Industry's Best Mixed-signal Stimulus Solution for Today's Complex Measurement Challenges

The AWG5000 Series of Arbitrary Waveform Generators delivers the optimal combination of sample rate, vertical resolution, signal fidelity, and waveform memory length, all in an easy-to-use self-contained package. The series offers the industry's best solution to the challenging signal stimulus issues faced by designers verifying, characterizing, and debugging sophisticated electronic designs.

Meeting the needs of today's design engineers, the series provides excellent dynamic range over all modulation bandwidths. AWG5000 Series models, with a 14-bit DAC, sample rates up to 1.2 GS/s, 2 to 4 output channels, synchronized 4 to 8 digital marker outputs, and 28 channels of digital data outputs, easily solve the toughest measurement challenges in wireless communications, defense electronics, digital consumer product design, data conversion equipment, test system synchronization, and semiconductor design and test.

The open windows (Windows 7) based instruments are easy, convenient to use, and connect with peripherals and other third-party software.

The capabilities of the AWG5000 Series are further enhanced by the addition of key features:

Equation Editor

The Equation Editor is an ASCII text editor that uses text strings to create waveforms by loading, editing, and compiling equation files. The editor

provides control and flexibility to create more complex waveforms using customer-defined parameters.

Waveform Sequencing and Subsequencing

Real-time sequencing creates infinite waveform loops, jumps, and conditional branches for longer pattern-length generation suitable for replicating real-world behavior of serial transmitters.

Dynamic Jump

The Dynamic Jump capability enables the creation of complex waveforms by enabling the ability to dynamically jump to any predefined index in a waveform sequence. Users can define up to 16 distinct jump indexes that respond to changing external environments.

LXI Class C

Using the LXI Web Interface, you can connect to the AWG5000 Series through a standard web browser by simply entering the AWG's IP address in the address bar of the browser. The web interface enables viewing of instrument status and configuration, as well as status and modification of network settings. All web interaction conforms to the LXI Class C specification.

Wireless I/Q and IF Signal Generation

The AWG5000 Series provides good SFDR over modulation bandwidths up to 180 MHz, meeting the demands of IQ and IF signal generation.

The RFXpress (RFX100) software package utilizes the raw AWG performance to simplify the creation of RF signals. Supporting a wide range of modulation schemes, the software is flexible enough to create either generic or propriety signals for digital communication systems. Power ramping, frequency hopping, and impairments can easily be added to generate the desired signal.

Radar Signal Creation is a software module for RFXpress that gives you the ultimate flexibility in creating pulsed radar waveforms. It gives you the ability to build your own radar pulse suite starting from pulse-to-pulse trains to pulse groups. It supports a variety of modulation schemes including LFM, Barker and Polyphase Codes, User-defined Codes, Step FM, Nonlinear FM, User-defined FM, and Custom modulation. It also has the ability to generate pulse trains with staggered PRI to resolve range and doppler ambiguity, frequency hopping for Electronic Counter-Counter Measures (ECCM), and pulse-to-pulse amplitude variation to simulate Swerling target models including antenna scan patterns, clutter, and multipath effects. RFXpress is a powerful easy-to-use software package to synthesize IQ and IF signals for arbitrary waveform generators. It runs as an integral part of the AWG5000 Series or from an external PC.

Environment Signal Generation

Radar signals must coexist with other commercial standard signals sharing the same spectrum, yet are still expected to perform with no performance degradation. This isn't unreasonable given its mission-critical operations. To meet this expectation, a radar designer has to thoroughly test all the corner cases at the design/debug stage. The AWG5000 and RFXpress Environment plug-in offers extreme flexibility to define and create these worst-case scenarios.

You can specify up to 25 signals to define your environment, including WiMAX, WiFi, GSM, GSM-EDGE, EGPRS 2A, EGPRS2B, CDMA, W-CDMA, DVB-T, Noise, and CW Radar. This plug-in also allows you to seamlessly import signals from other RFXpress plug-ins (including Radar, Generic Signal, etc.), as well as from Matlab® and from Tektronix spectrum analyzers and oscilloscopes, into your environment. You can also configure PHY parameters of your standard-specific signals. You can define the carrier frequency, power, start time, and duration for all the signals in your environment, so you have full control over the way these signals interact/interfere with each other.

Mixed-signal Generation

AWG5012 and AWG5002 models have an optional 28 digital output channels with high-resolution edge placement, making them a great

Mixed-signal test by TDS/TLA iView.

solution for digital signal generation applications, such as digital design and validation, system synchronization, and ADC/DAC testing.

Characteristics

Definitions

Specifications (not noted) – Product characteristics described in terms of specified performance with tolerance limits which are warranted/guaranteed to the customer. Specifications are checked in the manufacturing process and in the Performance Verification section of the product manual with a direct measurement of the parameter.

Typical (noted) – Product characteristics described in terms of typical performance, but not guaranteed performance. The values given are never warranted, but most units will perform to the level indicated. Typical characteristics are not tested in the manufacturing process or the Performance Verification section of the product manual.

Nominal (noted) – Product characteristics described in terms of being guaranteed by design. Nominal characteristics are non-warranted, so they are not checked in the manufacturing process or the Performance Verification section of the product manual.

AWG5000C Series Specifications

General Characteristics

Characteristic	AWG5014C	AWG5012C	AWG5002C
Digital to Analog Converter			
Sample rate	10 MS/s to 1.2 GS/s		10 MS/s to 600 MS/s
Resolution	14 bit		
Sin (x)/x Roll-off			
Sin (x)/x (-1 dB)	300 MHz		150 MHz
Sin (x)/x (-3 dB)	520 MHz		260 MHz

Frequency Domain Characteristics

Characteristic	AWG5014C	AWG5012C	AWG5002C
Output Frequency Characteristics			
Effective Frequency Output	Fmaximum (specified) is determined as "sample rate / oversampling rate" or "SR/2.5"		
Fmaximum	480 MHz		240 MHz
Fmaximum (typical)	540 MHz		275 MHz
Effective Frequency Switching Time	Minimum frequency switching time from selected frequencies F_1 to F_2 is determined as "1/Fmaximum"		
Standard			
Ts	2.1 ns		4.2 ns
Ts (typical)	1.8 ns		3.7 ns
Modulation Bandwidth	Modulation bandwidth is a combination of $\sin(x)/x$ and rise time bandwidths, defined as the lower of the $\sin(x)/x$ bandwidth or the calculated percentage of rise time bandwidth (as shown)		
Mod bandwidth (-1 dB) (typical) -1 dB BW = $0.932 \times (-1 \text{ dB TrBW})$	Normal: Up to 130 MHz Direct: Up to 180 MHz		Normal: Up to 100 MHz Direct: Up to 130 MHz
Mod bandwidth (-3 dB) (typical) -3 dB BW = $0.913 \times (-3 \text{ dB TrBW})$	Normal: Up to 230 MHz Direct: Up to 300 MHz		Normal: Up to 180 MHz Direct: Up to 230 MHz
Output Amplitude Characteristics			
Amplitude	Amplitude levels are measured as single-ended outputs. Amplitude level will be 3 dBm higher when using differential (both) outputs		
Range	Normal: -30 dBm to 17 dBm Direct: -30 dBm to 0 dBm		
Resolution	0.01 dB		
Accuracy	At 0 dBm level, with no offset, ± 0.3 dB		
Output Flatness	Mathematically corrected for characteristic $\sin(x)/x$ roll-off, uncorrected by external calibration methods		
Flatness (typical)	± 1.0 dB, from 10 MHz to 480 MHz		
Digital Data Out (Option 03)			
Number of outputs	14-bit output on Ch1 and Ch2 (28 total)		
Output connector	SMB (rear panel), single ended		
Output impedance	50 Ω		
Digital Data Out Levels (into 50 Ω)			
Window	-1.0 V to 2.7 V		
Amplitude	0.1 V_{p-p} to 3.7 V_{p-p}		
Resolution	10 mV		
Accuracy	$\pm(10\%$ of setting + 120 mV)		
Current (max)	± 54 mA per channel		
Rise/Fall time (20% to 80%)	300 ps (1.0 V_{p-p} , Hi: 1.0 V, Lo: 0 V)		
Delay from marker	-41 ns to -82 ns		
Skew between outputs	<400 ps		

Time Domain Characteristics

Characteristic	AWG5014C	AWG5012C	AWG5002C
Data Rate Characteristics			
Data Rate	Bit rate is determined as "sample rate / 4 points per cycle", allowing full impairment generation		
Bit rate (typical)	300 Mb/s		150 Mb/s
Rise/Fall Time Characteristics			
Rise/Fall Time	Rise/Fall time measured at 10% to 90% levels		
Tr/Tf	Normal: 1.4 ns Direct: 0.95 ns		
Rise Time Bandwidth	Rise-time bandwidth converted from rise-time ($0.34/T_r$, assumed Gaussian transition) characteristics through analog output circuitry and cabling		
Tr bandwidth (-1 dB) (typical)	Normal: 140 MHz Direct: 210 MHz		
Tr bandwidth (-3 dB) (typical)	Normal: 250 MHz Direct: 370 MHz		
Low-pass filter	Normal: Bessel Type, 50 and 100 MHz		
Output Amplitude Characteristics			
Amplitude	Amplitude levels are measured between differential outputs (+) and (-) For single-ended output (+) the amplitude level will be one-half the levels below		
Range	Normal: 40 mV _{p-p} to 9.0 V _{p-p} Direct: 40 mV _{p-p} to 1.2 V _{p-p}		
Resolution	1.0 mV		
Accuracy	At 0.5 V, with no offset, $\pm(2\%$ of amplitude ± 2 mV)		
Offset			
Range	Normal: ± 2.25 V		
Resolution	1.0 mV		
Accuracy	At minimum amplitude, $\pm(2.0\%$ of offset ± 10 mV)		

Common Characteristics
