AK5373

24-bit Stereo ADC with USB Interface

GENERAL DESCRIPTION

The AK5373 is a stereo A/D converter with a USB 2.0 interface. The device includes an integrated USB serial interface engine, a USB transceiver, an audio class processing block, endpoints, and a 24-bit stereo audio ADC. An integrated PLL enables the use of multiple sampling frequencies. A microphone amplifier and an integrated programmable gain amplifier are available for processing low-level signals from an analog microphone element. An external EEP-ROM is used to store the descriptor information. The AK5373 is housed in a 48-pin package. It is a low power device, operating from +3.3V, and consuming just 100mW in active mode and less than 100μA in suspend mode.

FEATURES

- **USB 2.0 compliant (full speed audio class)**
- **USB audio controller**
  - **USB serial interface engine**
  - **Audio class encoder/decoder**
- **USB synchronization**
  - **Synchronous type (synchronize with 1ms SOF)**
- **24-bit stereo A/D converter with mute control**
  - **S/(N+D) = 85dB, S/N = 91dB (AVDD=3.3V, MIC-Amp = 0dB)**
  - **S/(N+D) = 70dB, S/N = 78dB (AVDD=3.3V, MIC-Amp = +30dB)**
- **Microphone amplifier gain:**
  - **0dB, +6dB, +12dB, +18dB, +24dB, +30dB, +36dB**
- **Digital programmable gain: +24dB ~ -31dB, 1dB Step**
- **Integrated PLL supports standard sampling frequencies**
  - **8kHz, 11.025kHz, 16kHz, 22.05kHz, 32kHz 44.1kHz, 48kHz**
- **EEP-ROM interface for descriptors**
- **External Digital Audio Interface**
- **Power Management**
- **Low power consumption**
  - **30mA in active mode**
  - **Less than 100μA in suspend mode**
- **Power Supply:**
  - **Analog Power Supply (AVDD): 3.0 ~ 3.6V**
  - **Digital Power Supply (DVDD): 3.0 ~ 3.6V**
- **Ta = -10 ~ +70°C**
- **Package:**
  - **48pin LQFP (7 x 7 mm, 0.5mm pitch)**

OPERATION OVERVIEW

■ Overview of AK5373

The AK5373 is a stereo A/D converter with USB interface. It is easy to use since the control logic including USB audio class, stereo differential microphone amplifiers, two PLL's USB serial interface engine, and FIFO are integrated. All Descriptor contents are stored in EEP-ROM and customizable. For example, when supporting a mono microphone by 48kHz sampling rate only, what needed to be done is to prepare appropriate USB descriptor. There is no need for writing program codes.

The AK5373 also has an external audio steaming interface to connect other A/D converters or audio DSP's. When a high performance A/D converters is connected, A/D data generated by this A/D converter are transmitted via USB upstream. When an external audio DSP is connected, the output of AK5373 is processed by this DSP. The AK5373 receives this data again and transmits. I/F format is stored in the EEP-ROM header.

The AK5373 integrates the following blocks:

1. 24bit High Performance Stereo A/D Converter
   a) S/N: 91dB (MIC Gain=0dB), S/N: 78dB (MIC Gain=+30dB)
2. MIC Power Supply
   a) Output Voltage: 2.2V (typ)
3. Differential Microphone Amplifier
   a) Setting of Gain: 0dB, +6dB, +12dB, +18dB, +24dB, +30dB, +36dB
4. Digital Programmable Gain
   a) Gain Range: from +24dB to -31dB (Setting of gain: Max, Min and Initial value)
   b) Gain Step: 1dB/step (Fix)
5. PLL
   a) 16.0MHz or 24.0MHz crystal generator with output buffer (Available for External Clock input)
   b) Two PLLs
      - A/D_PLL: generate audio clock
      - System_PLL: generate USB system clock
6. Audio Synchronization Type
   a) Synchronous Type
      - Isochronous transfer uses Synchronous type synchronization which is synchronous to SOF (start of frame) packets which are issued per 1ms.
7. USB Audio Format
   a) Supports 7 Frequencies: 8kHz, 11.025kHz, 16kHz, 22.05kHz, 32kHz, 44.1kHz, 48kHz
   b) Stereo/Mono 24bit/16bit/8bit LSB first
8. FIFO
   a) Synchronization between A/D converter and USB bus
      - Memory Size 576 bytes: 24bit (3 bytes) x 48 samples x 2 channel x 2 frames
9. USB Serial Interface Engine
   a) Process USB Standard Requests
10. Control block of Audio Device Class
    a) Translate internal A/D format to USB audio class format
    b) Process USB Audio Class Request
       - Mute
       - Gain/Attenuation
       - Sampling Frequency Control
11. USB transceiver
12. EEP-ROM I/F
    SPI™ (4-wire) type EEP-ROM can be used to customize all USB descriptors and any functions.
       - 8K bits (AK6506C) or larger
13. USB Suspend/Resume Support
14. External Digital Audio Interface
    a) 24bit I^2S or MSB justified
    b) MCLK=256fs or 512fs, BICK=64fs
15. Stand-alone Mute
    a) Zero Crossing detection mute or One Shot mute (not support HID function)

■ Clock Source

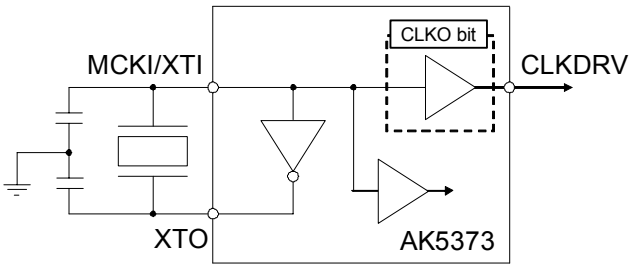
16MHz or 24 MHz crystal resonator can be used as the master clock. If the CKM pin is set to "H", the AK5373 supports 24MHz. If the CKM pin is set to "L", the AK5373 supports 16MHz. The AK5373 can drive the clock up to three external loads. The AK5373 generates 48MHz for system clock from 16MHz or 24MHz by system PLL circuit.

CKM pin	X'tal Frequency
L	16.0MHz
H	24.0MHz

Table 1. Reference X'tal frequency

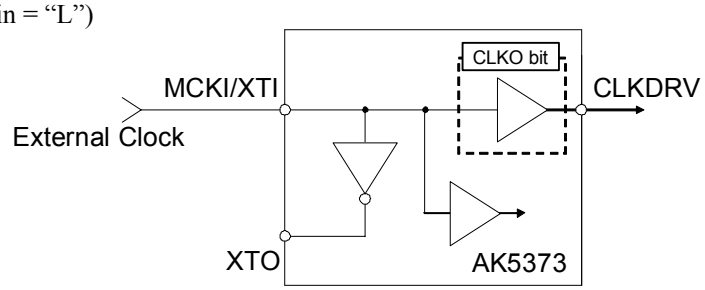
The clock for the MCKI/XTI pin can be generated by the following methods:

1) X'tal (XTE pin = "H")



Note 18. External capacitance depends on the crystal oscillator (Max. 30pF)
Figure 12. X'tal Mode

2) External clock (XTE pin = "L")



Note 19. Input clock must not exceed DVDD.
Figure 13. External clock mode

■ MIC Gain Amplifier

The AK5373 has a gain amplifier for microphone inputs. The gain of MIC-Amp is selected by the MGAIN2-0 pins or MGAIN2-0 bits (Table 2).

MGAIN2 pin	MGAIN1 pin	MGAIN0 pin	MGAIN2 bit	MGAIN1 bit	MGAIN0 bit	Input Gain
L	L	L	0	0	0	0dB
			0	0	1	0dB

H	L	H				+24dB
H	H	L				+30dB
H	H	H				+36dB

Table 2. Mic Input Gain (x: Don't care)

■ MIC Power

When PMMP bit = "1", the MPWR pin supplies power for the microphone. This output voltage is typically 2.2V and the output current is maximum 2.0mA. In case of using two sets of stereo full-differential microphones, the load resistance is minimum 1kΩ for each channel. Any capacitor must not be connected directly to the MPWR pin (Figure 14).

PMMP bit	MPWR pin
0	Hi-Z
1	Output

Table 3. MIC Power

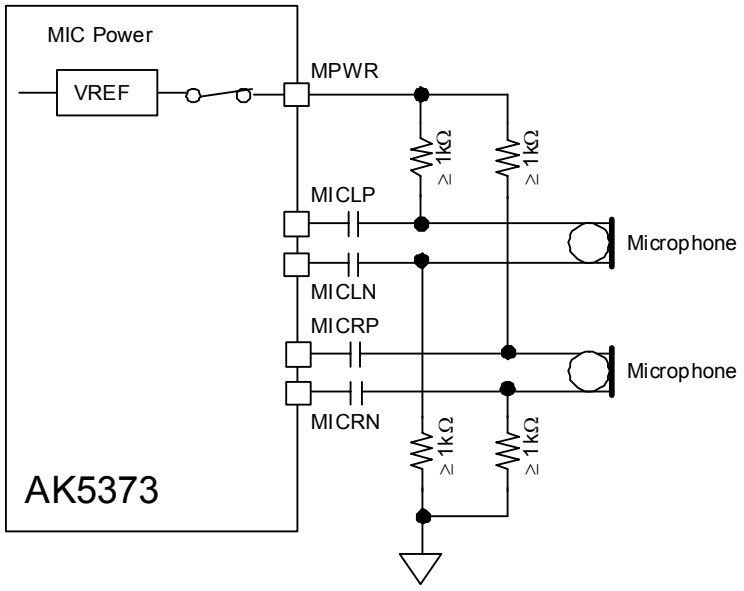

Figure 14. MIC Block Circuit

■ Digital High Pass Filter

The ADC has a digital high pass filter for DC offset cancellation. The cut-off frequency of the HPF is 0.93Hz at fs=48kHz. The digital high pass filter cut-off frequency scales with the sampling rate (fs). The HPF is always enabled.

■ Audio Data Format

The AK5373 supports 8bit, 16bit and 24bit audio data format and outputs LSB first to USB bus.

■ External Digital Audio Interface

The AK5373 has optional audio streaming interface to output A/D data, or to receive DSP data and to transmit them to the host. Because the AK5373 operates as a master device only, MCLK, LRCK, and BICK are output. The AK5373 supports two audio formats, I2S and MSB justified format. The data length of ADC outputs is 24bit only despite the USB audio formats which can be selected from 8/16/24 bit. This interface is specified in the header of EEP-ROM.

■ Volume & Mute Control

The AK5373 has a digital volume control which ranges from +24dB to -31dB in 1dB step. The maximum volume, the minimum and default volumes are defined by EEP-ROM header setting.

When ZCE bit = "1" (Zero cross detection enable), L-channel and R-channel volumes are changed independently on zero cross or zero cross timeout. Zero cross timeout is set by ZTM1-0 bits (Table 9). When ZCE bit = "0" (zero cross detection disable), the volume is changed immediately. Mute operation and zero cross detection have the same relation as the volume mentioned in this section.

ZTM1 bit	ZTM0 bit		Zero Crossing Timeout Period		
			8kHz	16kHz	44.1kHz

Table 9. Zero Crossing Timeout Period

The AK3573 has the LMUTEN and RMUTEN pins, and it can control mute operation from the device side. However, because the AK5373 does not have HID function, the mute operation by these pins cannot be acknowledged by the host. There are two modes for the mute operation by LMUTEN and RMUTEN pins; one is normal mute and the other is one-shot mute.

In normal mute operation (OSME bit = "0"), mute is executed on zero cross or zero cross timeout when the LMUTEN and RMUTEN pins = "L" if zero cross detection is enabled. When zero cross detection is disabled, it is executed immediately. In case that the LMUTEN and RMUTEN pins = "H", mute is released on zero cross or zero cross timeout if the zero cross detection is enabled. When zero cross detection is disabled, it is released immediately.

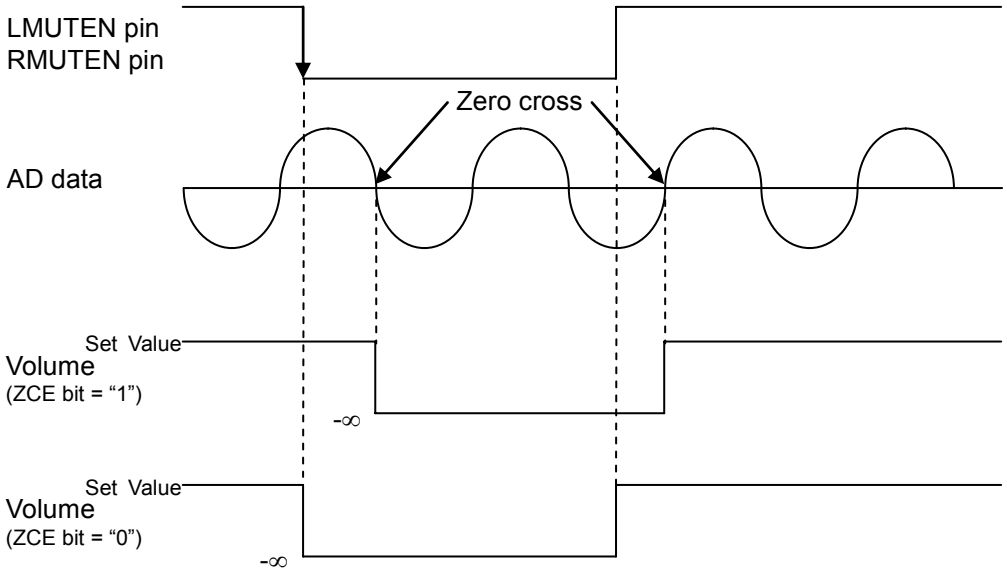

Figure 16. Normal Mute for LMUTEN, RMUTEN pins

In one-shot mute operation (OSME bit = "1"), mute is executed on zero cross or zero cross timeout after detecting a falling edge of the LMUTEN and RMUTEN pins. The AK5373 releases the mute on zero cross or zero cross timeout after mute hold period which is set by MHLD7-0 bits.

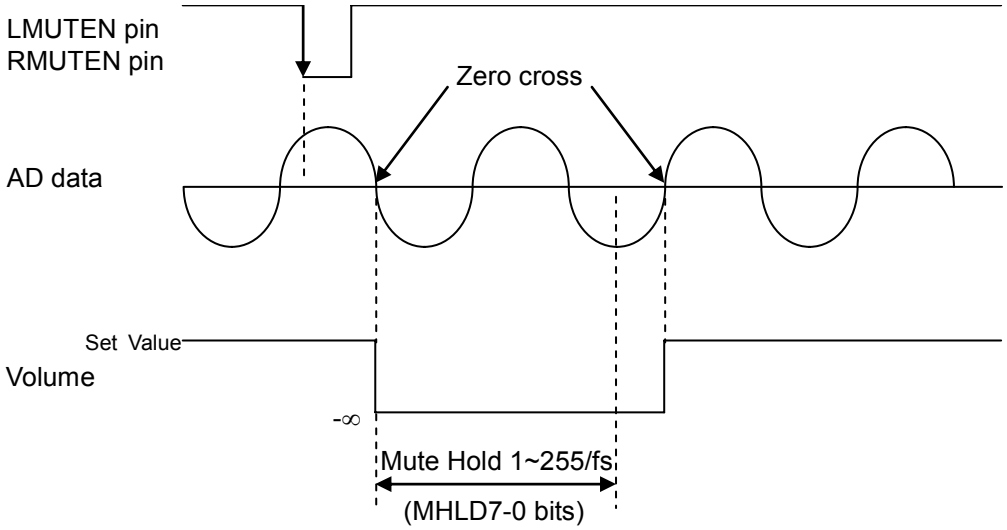

Figure 17. One Shot Mute for LMUTEN, RMUTEN pins

■ Power Management Control

USB specifies that the current at suspend mode must not exceed 500μA. When the USB host is in suspend mode, the SUSN pin also becomes to "L" in order to notify this mode to the external components like DSP's to observe USB specification.

■ Synchronization

The AK5373 supports synchronous type synchronization which is synchronous to SOF (start of frame) packets which are issued per 1ms.

■ Descriptor's Customization

USB audio class has very flexible, but complicated format. In order to keep both of the flexibility and simplicity to use, the AK5373 utilizes the precompiled control information in EEP-ROM instead of direct USB audio class decoding. Data in EEP-ROM is divided into two blocks; header information block and USB descriptor block. Header block size is fixed while USB descriptor block size is variable. Header information includes various control information such as audio format, the microphone's gain, power management information, and etc. When the device is powered up, at first the AK5373 reads the header block in EEP-ROM, and maps these values into the internal registers. Note that 8k bits or larger SPI type EEP-ROM is available.

The AK5373 does not store all of the descriptors into internal memory at the boot time. Instead, the AK5373 reads the descriptor from EEP-ROM and transmit it when it receives the "Get Descriptor" Request command. The AK5373 transmits NAK until it is ready to send data.

Header Information includes
1) Power Management Information
2) Microphone Gain
3) External Digital Audio Interface Information
4) Mute Control Information
5) Descriptor related information
    a) PCM format(stereo/mono, resolution) and the related alternate setting number
    b) Endpoint number
    c) Initial/Minimum/Maximum Volume

■ EEP-ROM Control Interface

Register information and descriptor information on EEP-ROM are read by SPI I/F (CSN, SK, EPAO and EPAI) pins. The data on the I/F consists of Instruction Byte, Address Byte (MSB first, 16bits) and Input Data Byte (MSB first, 8bits). The AK5373 outputs Instruction Byte and Address Byte on a falling edge of SK and down-loads address data from EPAI. The next address data is read by sending SK signal continuously. Data reading ends by a rising edge of CSN. SK clock speed is typically 1.5MHz. The AK5373 reads data from EEP-ROM according to a request signal from the USB host after releasing a reset.

■ Descriptors Specification (for example)

□ Customizable Block

All Descriptor contents are stored in EEP-ROM and customizable with some restrictions.

a) Device Descriptor, String Descriptor
   - Maximum Packet Size
   - idVendor
   - idProduct
   - Manufacturer Name (max. 126bytes)
   - Product Name (max. 126bytes)
   - Serial Number (max. 126bytes)
   - Language ID

b) Configuration Descriptor
   - Power Consumption

c) Feature Unit Descriptor: <Active> or < Bypass>
   - If Feature Unit is not defined in the descriptor, the volume is fixed to the initial value which is described in the EEP-ROM header block

d) PCM format (Note that the AK5373 supports 7 sample rates even when only 1 sample rate is specified in the descriptor.)

e) Endpoint Number

f) Maximum Value of Digital Gain

g) Minimum Value of Digital Gain

h) Initial Value of Digital Gain

□ Uncustomizable Block

a) Configuration Number (1)

b) Interface Number (1)

c) Input Terminal ID (1)

d) Output Terminal ID (2)

e) Feature Unit ID (3)

f) Synchronization way (support Synchronous Type)

g) Maximum Alternate Setting number (7)

h) Endpoint Number (1-7)

7	bSourceID	1	0x03	From Feature Unit
8	iTerminal	1	0x00	Not used. Must be set to 0.

3.5 Feature Unit Descriptor

Offset	Field	Size	Value	Description
0	bLength	1	0x0A	Size of this descriptor in bytes
1	bDescriptorType	1	0x24	CS_INTERFACE
2	bDescriptorSubtype	1	0x06	FEATURE_UNIT descriptor subtype
3	bUnitID	1	0x03	ID of this feature Unit
4	bSourceID	1	0x01	ID to Terminal to which this is connected.
5	bControlSize	1	0x01	Size in bytes of an element of the bmaControl()
6	bmaControls(0)	1	0x01	D0(Mute) is enable for ch 0
7	bmaControls(1)	1	0x02	D1(Volume) is enable for ch 1 (Left)
8	bmaControls(2)	1	0x02	D1(Volume) is enable for ch 2 (Right)
9	iFeature	1	0x00	Not used. Must be set to 0.

4. Audio Streaming Interface Descriptor

4.1 Zero-bandwidth Alternate Setting

4.1.1 Standard Audio Streaming Interface Descriptor (Alt = 0)

Offset	Field	Size	Value	Description
0	bLength	1	0x09	Size of this descriptor in bytes

■ Audio Control Requests

1. Set Feature Unit Control Request

1-1. Mute Control

Offset	Field	Size	Value	Description
0	bmRequestType	1	0x21	
1	bRequest	1	0x01	SET_CUR
2	wValue	2	0x0100	MUTE_CONTROL | CHANNEL_0
4	wIndex	2	0x0300	Upper byte: bUnitID field in Feature Unit Control Descriptor (0x03) Lower byte: Audio Control Interface (0x00)
6	wLength	2	0x0001	Length of parameter block

The parameter block of mute control is the following.

Offset	Field	Size	Value	Description
0	bMute	1	0x01 0x00	Mute Not mute

1-2. Volume Control

Offset	Field	Size	Value	Description
0	bmRequestType	1	0x21	
1	bRequest	1	0x01	SET_CUR
2	wValue	2	0x0200 0x0201 0x0202	VOLUME_CONTROL | CHANNEL_0 (Master) VOLUME_CONTROL | CHANNEL_1 VOLUME_CONTROL | CHANNEL_2

6	wLength	2	0x0002	Length of Parameter Block

The parameter block of volume control is the following.

Offset	Field	Size	Value	Description
0	wVolume	2	0xZZZZ	The value is mapped to the volume register value. (Table 10) (ZZZZ is assigned by Host.)

If the wVolume exceeds the range, the AK5373 adjusts the value into the range.

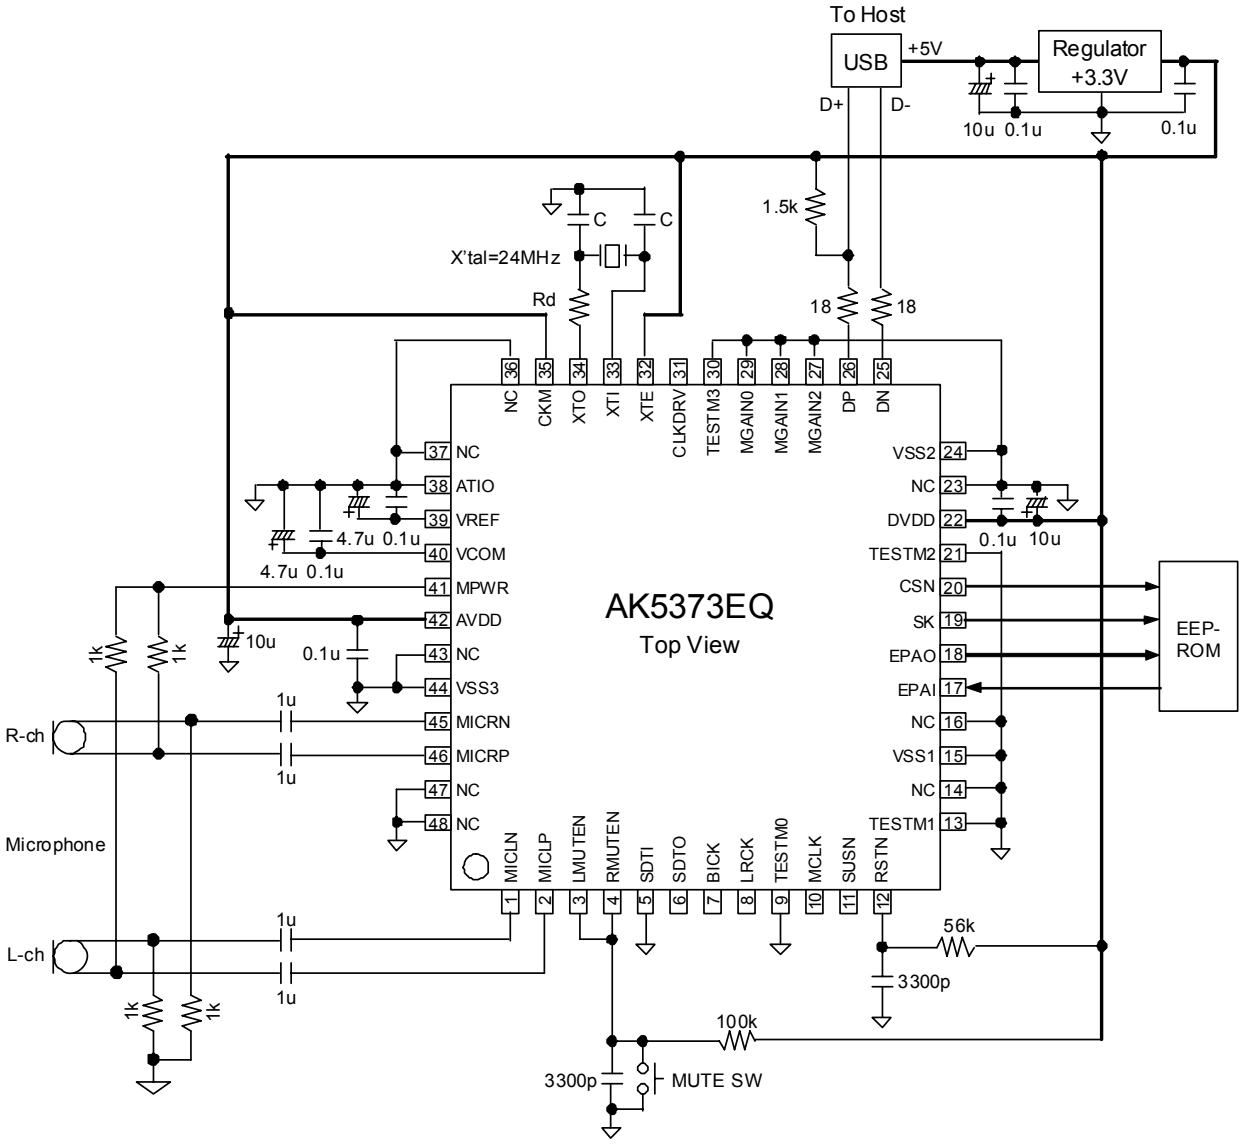
SYSTEM DESIGN

Figure 21 shows the system connection diagram. An evaluation board (AKD5373) is available for fast evaluation as well as suggestions for peripheral circuitry.



Notes:

- "C" and "Rd" values are dependent on the crystal. When the 24MHz crystal oscillator is used (CKM pin = "H"), AT-41-24.000M-LN-N-0005 (Nihon Dempa Kogyo) or HC49SFNB24000H0PESZ1 (Kyocera) is recommended. When the 16MHz crystal oscillator is used (CKM pin = "L"), AT-41-16.000M-LN-N-0005 (Nihon Dempa Kogyo) or HC49SFNB16000H0PESZ1 (Kyocera) is recommended.
- VSS1-3 must be connected the same ground plane.
- All digital input pins must not be left floating.

Figure 21. System Connection Diagram

1. Grounding and Power Supply Decoupling

The AK5373 requires careful attention to power supply and grounding arrangements. AVDD and DVDD are usually supplied from the system's analog supply. If AVDD and DVDD are supplied separately, the power-up sequence is not critical. VSS1-3 of the AK5373 must be connected to the analog ground plane. System analog ground and digital ground must be connected together near to where the supplies are brought onto the printed circuit board. Decoupling capacitors must be as near to the AK5373 as possible, with the small value ceramic capacitor being the nearest.

2. Voltage Reference

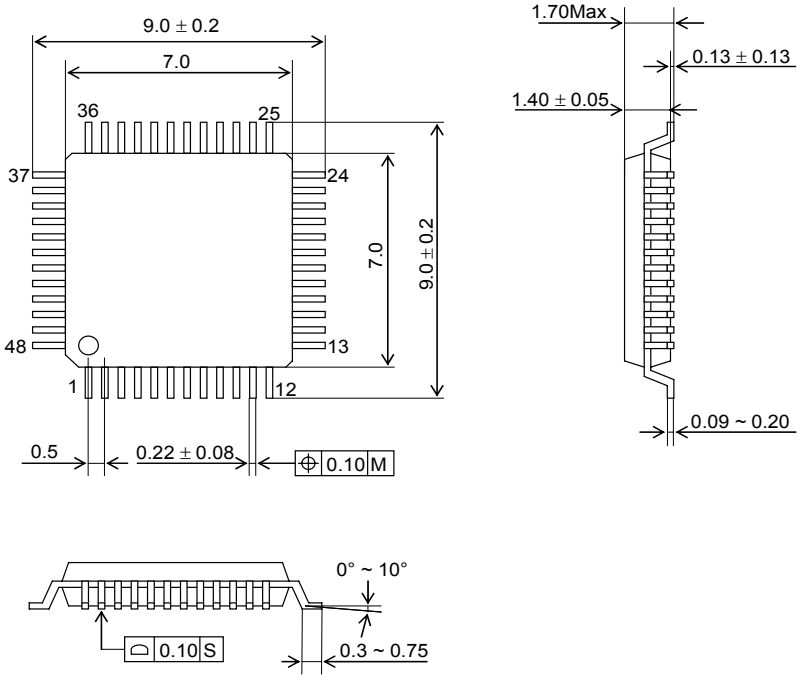
The voltage of VREF is 2.2V (typ) and set the analog input range. VCOM is 50%VREF and a signal ground of this chip. A 4.7μF electrolytic capacitor in parallel with a 0.1μF ceramic capacitor attached to the VREF pin and the VCOM pin eliminates the effects of high frequency noise. No load current may be drawn from the VREF pin and the VCOM pin. All signals, especially clocks, should be kept away from the VREF pin and the VCOM pin in order to avoid unwanted coupling into the AK5373.

3. Analog Inputs

The analog inputs are full-differential and input resistance is 20kΩ (typ). The input signal range is typ. ±0.038Vpp (@MGAIN = +30dB) and typ. ±1.2Vpp (@MGAIN = 0dB), centered around the internal common voltage (typ. 1.1V). Usually the input signal is AC coupled using a capacitor. The cut-off frequency is fc = 1/ (2πRC). The DC offset including the ADC's own DC offset is removed by the internal HPF (fc=0.93Hz@fs=48kHz). The AK5373 can accept input voltages from VSS1 to VREF.

PACKAGE

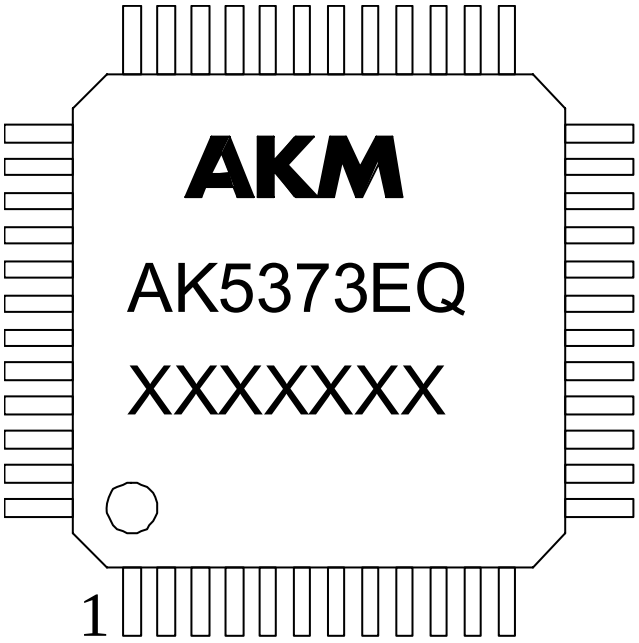
■ 48pin LQFP (Unit: mm)



■ Package & Lead frame material

Package molding compound:	Epoxy, Halogen (bromine and chlorine) free
Lead frame material:	Cu
Lead frame surface treatment:	Solder (Pb free) plate

MARKING



1) Pin #1 indication
2) Date Code: XXXXXXX (7 digits)
3) Marking Code: AK5373EQ
4) Asahi Kasei Logo

IMPORTANT NOTICE

- These products and their specifications are subject to change without notice.
  When you consider any use or application of these products, please make inquiries the sales office of Asahi Kasei Microdevices Corporation (AKM) or authorized distributors as to current status of the products.
- Descriptions of external circuits, application circuits, software and other related information contained in this document are provided only to illustrate the operation and application examples of the semiconductor products. You are fully responsible for the incorporation of these external circuits, application circuits, software and other related information in the design of your equipments. AKM assumes no responsibility for any losses incurred by you or third parties arising from the use of these information herein. AKM assumes no liability for infringement of any patent, intellectual property, or other rights in the application or use of such information contained herein.
- Any export of these products, or devices or systems containing them, may require an export license or other official approval under the law and regulations of the country of export pertaining to customs and tariffs, currency exchange, or strategic materials.
- AKM products are neither intended nor authorized for use as critical components$_{Note1)}$ in any safety, life support, or other hazard related device or system$_{Note2)}$, and AKM assumes no responsibility for such use, except for the use approved with the express written consent by Representative Director of AKM. As used here:
  Note1) A critical component is one whose failure to function or perform may reasonably be expected to result, whether directly or indirectly, in the loss of the safety or effectiveness of the device or system containing it, and which must therefore meet very high standards of performance and reliability.
  Note2) A hazard related device or system is one designed or intended for life support or maintenance of safety or for applications in medicine, aerospace, nuclear energy, or other fields, in which its failure to function or perform may reasonably be expected to result in loss of life or in significant injury or damage to person or property.
- It is the responsibility of the buyer or distributor of AKM products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the above content and conditions, and the buyer or distributor agrees to assume any and all responsibility and liability for and hold AKM harmless from any and all claims arising from the use of said product in the absence of such notification.
