

Hexa half-bridge driver with SPI control for automotive applications

Features

- 6 half bridges
- $R_{ON} = \text{typ.} 0.9 \Omega$ (HS), 0.64Ω (LS) at $T_j = 25 \text{ }^\circ\text{C}$
- Current limit of each output at minimum 0.8 A
- Internal PWM generation
- PWM mode option for all half bridges for hold current
- Two current monitor outputs
- SPI interface for data communication
- Temperature warning
- All outputs overtemperature protected
- All outputs short circuit protected
- V_{CC} supply voltage 3.0 to 5.3 V
- Very low current consumption in standby mode typ. $5 \mu\text{A}$
- V_S operating range compliant: 6 – 18 V

Applications

- DC motor driver Intended to drive HVAC flaps

Description

The L99MD02 IC is a 6 x half bridge driver for automotive applications. The device is intended to drive DC-motors. It is possible to drive 3 DC-motors simultaneously or up to 5 DC-motors sequentially.

The integrated 24 bit standard serial peripheral interface (SPI) controls all outputs and provides diagnostic information: normal operation, open-load in on-state, overcurrent, temperature warning and overtemperature.

1 Block diagram

Figure 1. Detailed block diagram

2 Overview

2.1 Power supply: V_{CC}

The supply voltage V_{CC} (3.3 V / 5 V) supplies the whole device. In case of power-on (V_{CC} increases from undervoltage to $V_{POR\ OFF} = 2.75$ V, typical) the circuit is initialized by an internally generated power-on reset (POR). If the voltage V_{CC} decreases under the minimum threshold ($V_{POR\ ON} = 2.55$ V, typical), the outputs are switched off in 3-state (high impedance). The status registers are cleared and the control registers are reset to their default.

Figure 2. Power on reset

2.2 Power supply: V_{SA} , V_{SB}

Each V_{SA} and V_{SB} supplies the half bridges independently.

$V_{SA} \rightarrow$ Out 1 to Out 3

$V_{SB} \rightarrow$ Out 4 to Out 6

2.3 Standby mode

The standby mode of the L99MD02 is activated by EN pin to low. The inputs and outputs are switched off. The status registers are cleared and the control registers are reset to their default values.

In the standby mode the current consumption is typically 5 μ A.

2.4 PWM mode

PWM frequency typ. 100 Hz.

Duty cycle (SPI 2bit): 15%, 30%, 45% and 60%.

Each half-bridge is independently addressable (SPI 8bit).

2.5 Current monitor

The current monitor output sources a current image at the current monitor output which has a programmable ratio (1/250, 1/500, 1/750, 1/1000) of the instantaneous current of the selected half bridge (high side or low side). Via SPI it can be programmed which of the outputs will be multiplexed to the current monitor output.

The current monitor output allows a more precise analysis of the actual state of the load rather than the detection of an open-or overload condition. For example this can be used to detect the motor state (starting, free-running, stalled).

2.6 Inductive loads

Each half bridge is built by an internally connected high-side and a low-side power DMOS transistor. Due to the built-in reverse diodes of the output transistors, inductive loads can be driven at the outputs

2.7 Diagnostic functions

All diagnostic functions (over/open-load, temperature warning and thermal shutdown, over/undervoltage) are internally filtered and the condition has to be valid for at least 32 μ s (open-load: typ. 2 ms, respectively) before the corresponding status bit in the status registers will be set. The filters are used to improve the noise immunity of the device. Open-load and temperature warning function are intended for information purpose and will not change the state of the output drivers. On contrary, the overload and thermal shutdown condition will disable the corresponding driver (overload) or all drivers (thermal shutdown), respectively. The microcontroller has to clear the overcurrent status bit to reactivate the corresponding driver.

2.8 Temperature warning and thermal shutdown

If the junction temperature rises above $T_{jTW ON}$ a temperature warning flag is set and is detectable via the SPI. If the junction temperature increases above the second threshold $T_{jSD ON}$, the thermal shutdown bit will be set and power DMOS transistors of all output stages are switched off to protect the device. Temperature warning flag and thermal shutdown bits are latched. In order to reactivate the output stages, the junction temperature must decrease below $T_{jSD ON} - T_{jSD HYS}$ and the thermal shutdown bit has to be cleared by the microcontroller.

2.9 V_S , V_{SA} , V_{SB} monitoring

- V_S undervoltage: Status bit will be set. Have to be cleared via SPI.
All outputs will be switched off.
- V_S overvoltage: Status bit will be set. Has to be cleared via SPI.
All outputs will be switched off (default). Can be deactivated via SPI.
- V_{SA} undervoltage: Status bit will be set. Has to be cleared via SPI.
Out 1 to Out 6 will be switched off.
- V_{SB} undervoltage: Status bit will be set. Has to be cleared via SPI.
Out 1 to Out 6 will be switched off.

Table 2. V_S , V_{SA} , V_{SB} monitoring

	'typ	Out x
V_S undervoltage	5.7 V	Status + off
V_S overvoltage	22.0 V	Status + (off or mask)
V_{SA} undervoltage	5.7 V	Status + off
V_{SB} undervoltage	5.7 V	Status + off

2.10 Open-load detection

The open-load detection monitors the load current in each activated output stage. If the load current is below the open-load detection threshold for at least 2 ms (t_{dOL}) the corresponding open-load bit is set in the status register.

Due to mechanical/electrical inertia of typical loads a short activation of the outputs (e.g. 3 ms) can be used to test the open-load status without changing the mechanical/ electrical state of the loads.

2.11 Overload detection

In case of an overcurrent condition, a flag is set in the corresponding status register. If the overcurrent signal is valid for at least $t_{ISC} = 32 \mu s$, the overcurrent flag is set and the corresponding switch is switched off to reduce the power dissipation and to protect the integrated circuit. The microcontroller has to clear the status bit to reactivate the corresponding driver.

2.12 Cross-current protection

The device is cross-current protected by an internal delay time. If one driver (LS or HS) is turned-off the activation of the other driver of the same half bridge will be automatically delayed by the cross-current protection time. After the cross-current protection time is expired the slew-rate limited switch-off phase of the driver will be changed to a fast turn-off phase and the opposite driver is turned-on with slew-rate limitation. Due to this behavior it is

always guaranteed that the previously activated driver is totally turned-off before the opposite driver will start to conduct. If wrong SPI commands try to turn-on both driver (LS and HS) simultaneously, the high side and the low side will be (or stay) deactivated (3-state).

3 Pin definitions and functions

Table 3. Pin description

Pin	Symbol	Function
1, 18, 19, 36	P _{GND}	Power ground: reference potential
9	A _{GND}	Analog ground: reference potential
27	D _{GND}	Digital ground: reference potential
6, 10, 13, 21, 23, 25, 32, 34	N.C.	Not connected
		Exposed pad: reference potential connected to P _{GND}
2, 3, 16, 17, 20, 35	OUT 1 -6	Half bridge-output: the output is built by a high-side and a low-side switch, which are internally connected. The output stage of both switches is a power DMOS transistor. Each driver has an internal parasitic reverse diode (bulk-drain-diode: high-side driver from output to V _{Sx} , low-side driver from P _{GND} to output).
29	V _{CC}	Logic voltage supply 3.3V / 5V for this input a ceramic capacitor as close as possible to GND is recommended
4, 5, 33	V _{SA}	Power supply voltage for OUT 1 to 3 (external reverse protection required): for this input a ceramic capacitor as close as possible to GND is recommended. Important: For the capability of driving the full current at the outputs all pins of V _{SA} must be externally connected!
14, 15, 22	V _{SB}	Power supply voltage for OUT 4 to 6 (external reverse protection required): for this input a ceramic capacitor as close as possible to GND is recommended. Important: For the capability of driving the full current at the outputs all pins of V _{SB} must be externally connected!
11	V _S	V _S
12	V _S	V _S supply and monitoring
7, 8	CURR1 / 2	Current monitor 1 / 2
31	EN	Enable enable the L99MD02
28	DI	SPI data in the input requires CMOS logic levels and receives serial data from the microcontroller. The data is a 24 bit control word and the most significant bit (MSB) is transferred first.
26	DO	SPI data out the diagnosis data is available via the SPI and this 3-state output. The output will remain in 3-state, if the chip is not selected by the input CSN (CSN = high)
24	CSN	SPI CSN chip select not (active low) this input is low active and requires CMOS logic levels. The serial data transfer between the L99MD02 and micro controller is enabled by pulling the input CSN to low level.
30	SCK	SPI serial clock input this input controls the internal shift register of the SPI and requires CMOS logic levels.

1. See [Section 5.1: SPI timing parameter definition](#)

5.1 SPI timing parameter definition

Figure 5. SPI timing

Figure 6. Serial output timing

6 Functional description of the SPI

6.1 Signal description

6.1.1 Serial clock (SCK)

This input signal provides the timing of the serial interface. Data present at Serial Data Input (SDI) is latched on the rising edge of Serial Clock (SCK). Data on Serial Data Out (SDO) is shifted out at the falling edge of serial clock (see [Figure 7](#)). The SPI can be driven by a microcontroller with its SPI peripherals running in following mode: CPOL = 0 and CPHA = 0 (see [Figure 7](#)).

6.1.2 Serial data input (SDI)

This input is used to transfer data serially into the device. It receives the data to be written. Values are latched on the rising edge of Serial Clock (SCK).

6.1.3 Serial data output (SDO)

This output signal is used to transfer data serially out of the device. Data is shifted out on the falling edge of Serial Clock (SCK). SDO also reflects the status of the <Global Error Flag> (Bit 7 of the <Global Status Register>) while CSN is low and no clock signal is present

6.1.4 Chip select not (CSN)

When this input signal is High, the device is deselected and Serial Data Output (SDO) is high impedance (3-state). Driving this input low enables the communication. The communication must start and stop on a low level of Serial Clock (SCK).

Figure 7. Clock polarity and clock phase

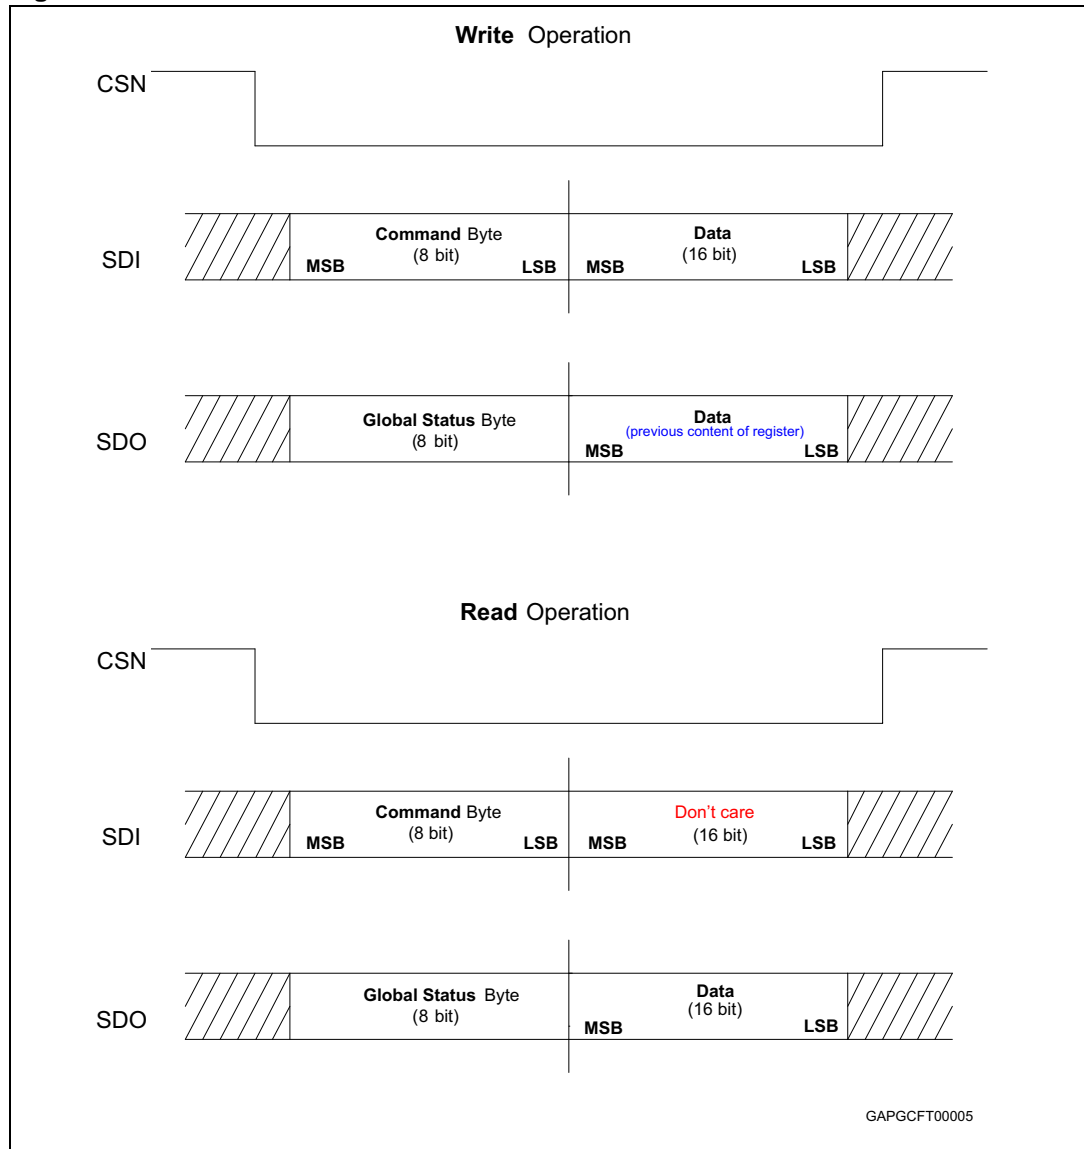

Figure 8. SPI frame structure

6.2 SPI communication flow

6.2.1 General description

The proposed SPI communication is based on a standard SPI interface structure using CSN (Chip Select Not), SDI (Serial Data In), SDO (Serial Data Out/Error) and SCK (Serial Clock) signal lines. Maximum SPI frequency is 1 MHz.

At the beginning of each communication the master reads the <SPI-frame-ID> register (ROM address 3EH) of the slave device. This 8-bit register indicates the SPI frame length (24 bit for the L99MD02) and the availability of additional features.

Each communication frame consists of an instruction byte which is followed by 2 data bytes (Figure 8).

The data returned on SDO within the same frame always starts with the <Global Status> register. It provides general status information about the device. It is followed by 2bytes (i.e. 'In-frame-response', [Figure 8](#)).

For write cycles the <Global Status> register is followed by the previous content of the addressed register.

For read cycles the <Global Status> register is followed by the content of the addressed register.

Table 17. Command byte (8 bit)

	Operating code		Address					
Bit	23	22	21	20	19	18	17	16
Name	OC1	OC0	A5	A4	A3	A2	A1	A0

Table 18. Data byte

	Data Byte 1								Data Byte 0							
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

6.2.2 Command byte

Each communication frame starts with a command byte. It consists of an operating code which specifies the type of operation (<Read>, <Write>, <Read and Clear Status>, <Read Device Information>) and a 6 bit address.

Table 19. Operating code definition

OC1	OC0	Meaning
0	0	<Write mode>
0	1	<Read mode>
1	0	<Read and clear status>
1	1	<Read device information>

The <Write Mode> and <Read Mode> operations allow access to the RAM of the device, i.e. write to control registers or read status information.

A <Read and Clear Status> Operation addressed to a device specific status register will read back and subsequently clear this status register. A <Read and Clear Status> Operation with address 3FH clears all status registers at a time and reads back the <Configuration> register.

A <Read and Clear Status> operation addressed to an unused RAM address register will be identical to a <Read Mode> operation (in case of unused RAM address, the second byte will be equal to 00H).

<Read Device Information> allows access to the ROM area which contains device related information such as the product family, product name, silicon version and register width.

Table 20. Global status byte

Bit	Description	Polarity	Comment						
0	Software reset or under/ overvoltage	Active high	Depend on bit 5 of <Global Status Byte>:						
			<table border="1"> <thead> <tr> <th>Bit 5</th> <th>Bit 0</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Set if software reset (SDI stuck at 1 or 0)</td> </tr> <tr> <td>1</td> <td>Logical OR of the under- / overvoltage status bits</td> </tr> </tbody> </table>	Bit 5	Bit 0	0	Set if software reset (SDI stuck at 1 or 0)	1	Logical OR of the under- / overvoltage status bits
			Bit 5	Bit 0					
0	Set if software reset (SDI stuck at 1 or 0)								
1	Logical OR of the under- / overvoltage status bits								
1	Overcurrent detected	Active high	Set by any overcurrent event						
2	Open-load detected	Active high	Set by any open-load event						
3	Temp warning	Active high							
4	Thermal shutdown / chip overload	Active high							
5	NOT (chip reset or communication error)	Active low	Activated by all internal reset events that change device state or configuration registers (e.g. software reset, V _{CC} under-voltage, etc.). The bit will be set after a valid communication with any register. This bit is initially '0' and will be set to '1' by a valid SPI communication						
6	Communication error	Active high	Bit is set if the number of clock cycles during CSN = low does not match with the specified frame width or if an invalid bus condition is detected (SDI stuck at 1 or 0).						
7	Global error flag	Active high	Logic OR combination of all failures in the <Global Status Byte>.						

The <Global Error Flag> is generated by an OR-combination of all failure events of the device (i.e. Bit 0 to Bit 6 of the <Global Status Byte>).

Figure 9. Indication of the global error flag on SDO when CSN is low and SCK is stable

The bit 0 of the <Global Status Byte> is a combination of an under/overvoltage warning and a software warning: If the bit 5 is one (this is the standard after a correct SPI communication), bit 0 is the logical OR of all under- and overvoltage status bits.

On the other hand, if there has been an SPI communication error or a chip reset (bit 5 is zero), then bit 0 gives a better indication about the SPI error: An SDI stuck-at error will lead to a software reset and will set bit 0, while a clock pulse error only sets the communication error bit, clears bit 5 and will clear also bit 0. This leads to the following table of possible states (assuming there is no under/overvoltage, overcurrent, openload or thermal error):

Table 21. Reset

State	Description	Global status
EN = 0 (Power on reset)	All registers reset Outputs switched off (3-state)	1000 0000
Clock cycles != 24	Ignore frame No reset	1100 0000
SDI always 0	Software reset Outputs switched off	1100 0001
SDI always 1	Software reset Outputs switched off	1100 0001

Writing to the selected data input register is only enabled if exactly one frame length is transmitted within one communication frame (i.e. CSN low). If more or less clock pulses are counted within one frame, the complete frame will be ignored and a SPI frame error is signaled in the Global Status register. This safety function is implemented to avoid an unwanted activation of output stages by a wrong communication frame.

For read operations, the *<communication error>* bit in the *<Global Status Byte>* will be set, but the register to be read will still be transferred to the SDO pin. If the number of clock cycles is smaller than the frame width, the data at SDO will be truncated. If the number of clock cycles is larger than the frame width, the data at SDO will be filled with '0' bits.

Due to this safety functionality a daisy chaining of SPI is not possible. Instead, a parallel operation of the SPI bus by controlling the CSN signal of the connected ICs is recommended.

Note: As the frame width is 24 bits, an initial read of *<SPI-frame-ID>* using a 16 bits communication will set the *<communication Error bit>* of the *<Global Status Byte>*. A subsequent correct length transaction is necessary to correct this bit.

6.3 Write operation

OC0, OC1: operating code (00 for 'write' mode).

The write operation starts with a command byte followed by 2 data bytes.

For write cycles the *<Global Status>* register is followed by the previous content of the addressed register.

The RAM memory area consists of 16 bit registers. All unused RAM addresses will be read as '0'.

Failures are indicated by activating the corresponding bit of the *<Global Status>* register.

Note: RAM address 00H is unused. An attempt to access this address is recognized as a communication line error ('Data-in stuck to GND') and all internal registers will be cleared (software reset).

6.4 Read operation

OC0, OC1: operating code (01 for 'read' mode).

The read operation starts with a command byte followed by 2 data bytes. The content of the data bytes is 'don't care'. The content of the addressed register is shifted out at SDO within the same frame ('inframe response'). The returned data byte represents the content of the register to be read. Failures are indicated by activating the corresponding bit of the *<Global Status>* register.

6.5 Read and clear status operation

OC0, OC1: operating code (10 for 'read and clear status' mode).

The 'Read and Clear Status' operation starts with a command byte followed by 2 data bytes.

The content of the data bytes is 'don't care'. The content of the addressed status register is transferred to SDO within the same frame ('in-frame response') and is subsequently cleared.

A 'Read and Clear Status' operation with address 3FH clears all Status registers simultaneously.

A <Read and Clear Status> operation addressed to an unused RAM address will be identical to a <Read Mode> operation (in case of unused RAM address, the second byte will be equal to 00H).

The returned data byte represents the content of the register to be read.

Failures are indicated by activating the corresponding bit of the <Global Status> register.

6.6 Read device information

OC0, OC1: operating code (11 for 'read device information mode')

The device information is stored at the ROM. In the ROM memory area, the first 8 bits are used. All unused ROM addresses will be read as '0'.

Note: ROM address 3FH is unused. An attempt to access this address is recognized as a communication line error ('Data-in stuck to Vcc') all internal registers will be cleared (software reset).

7 SPI control and status register

Table 22. RAM memory map

Address	Name	Access	Content

Table 34. Status register 2 (read only); address 12h

Bit	Name	Comment
15-8	-	-
7	TSD	Overtemperature detected: all the drivers are switched off
6	TSD warning	Overtemperature warning level detected, information only
5	-	
4	-	
3	V _S UV	V _S undervoltage
2	V _S OV	V _S overvoltage
1	V _{SB} UV	V _{SB} undervoltage
0	V _{SA} UV	V _{SA} undervoltage

8 Application examples

Figure 10. Driving 3 DC-motors simultaneously

Figure 11. Driving 5 DC-motors sequentially

9 Package and PCB thermal data

9.1 PowerSSO-36 thermal data

Figure 13. PowerSSO-36 thermal impedance junction ambient

10 Package information

10.1 ECOPACK[®] package

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK[®] packages, depending on their level of environmental compliance. ECOPACK[®] specifications, grade definitions and product status are available at: www.st.com. ECOPACK[®] is an ST trademark.

10.2 PowerSSO-36[™] mechanical data

Figure 14. PowerSSO-36[™] package dimensions

Table 35. PowerSSO-36 mechanical data

Symbol	Millimeters		
	Min.	Typ.	Max.
A	2.15	-	2.45
A2	2.15	-	2.35
a1	0	-	0.1
b	0.18	-	0.36
c	0.23	-	0.32
D ⁽¹⁾	10.10	-	10.50
E	7.4	-	7.6
e	-	0.5	-
e3	-	8.5	-
F	-	2.3	-
G	-	-	0.1
G1	-	-	0.06
H	10.1	-	10.5
h	-	-	0.4
k	0°	-	8°
L	0.55	-	0.85
M	-	4.3	-
N	-	-	10°
O	-	1.2	-
Q	-	0.8	-
S	-	2.9	-
T	-	3.65	-
U	-	1	-
X	4.3	-	5.2
Y	6.9	-	7.5

1. "D" and "E" do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.15 mm per side (0.006").

10.3 Packing information

Figure 16. PowerSSO-36 tape and reel shipment (suffix "TR")

11 Revision history

Table 36. Document revision history

Date	Revision	Changes
30-Jul-2009	1	Initial release.
21-Jun-2010	2	<p>Updated Features list. Removed Block diagram on page 1. Updated Figure 1: Detailed block diagram. Updated Section 2.3: Standby mode. Chapter 3: Pin definitions and functions: – Updated Table 3: Pin description – Updated Figure 3: Pin connection (top view-not in scale) Updated Table 16: Dynamic characteristics and Table 24: Control status register. Inserted Table 30: Control register 5 (read/write); address 05h Added Chapter 10: Package information.</p>
25-Jan-2011	3	<p>Updated Figure 2: Power on reset Updated Features list. Table 9: Over and undervoltage detection – $V_{SUV\ OFF}$, $V_{SUV\ ON}$, $V_{SAUV\ ON}$, $V_{SBUV\ OFF}$, $V_{SBUV\ ON}$: updated maximum value – $V_{SUV\ hyst}$, $V_{SAUV\ hyst}$, $V_{SBUV\ hyst}$, $V_{SOV\ hyst}$: added minimum value – $V_{SAUV\ OFF}$: updated minimum and maximum values Table 10: Switches – Updated following parameters: $r_{ONLSLC\ 1-6}$, $t_{D\ LH}/t_{D\ LH}$, I_{QLH}, I_{QLL}, $I_{OLDHS1-6}$, $I_{OLDLSHC1-6}$, $I_{OLDLSLC1-6}$ Table 11: Current monitor output – Updated $I_{CURR1/2\ acc}$ parameter Added Table 12: Current monitor dynamic characteristics Updated following tables: – Table 25: Control register 1 (read/write); address 01h – Table 26: Control register 3 (read/write); address 03h – Table 27: Control register 4 (read/write); address 04h – Table 30: Control register 5 (read/write); address 05h – Table 31: Control register 6 (read/write); address 06h – Table 32: Status register 0 (read only); address 10h – Table 33: Status register 1 (read only); address 11h Added Chapter 9: Package and PCB thermal data</p>

Table 36. Document revision history (continued)

Date	Revision	Changes
23-Feb-2011	4	Updated <i>Features</i> list. Updated <i>Section 2.2: Power supply: V_{SA}, V_{SB}</i> Updated following tables: – <i>Table 3: Pin description</i> – <i>Table 11: Current monitor output</i> – <i>Table 12: Current monitor dynamic characteristics</i> – <i>Table 16: Dynamic characteristics</i> – <i>Table 20: Global status byte</i>
19-Sep-2013	5	Updated disclaimer.

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

ST PRODUCTS ARE NOT DESIGNED OR AUTHORIZED FOR USE IN: (A) SAFETY CRITICAL APPLICATIONS SUCH AS LIFE SUPPORTING, ACTIVE IMPLANTED DEVICES OR SYSTEMS WITH PRODUCT FUNCTIONAL SAFETY REQUIREMENTS; (B) AERONAUTIC APPLICATIONS; (C) AUTOMOTIVE APPLICATIONS OR ENVIRONMENTS, AND/OR (D) AEROSPACE APPLICATIONS OR ENVIRONMENTS. WHERE ST PRODUCTS ARE NOT DESIGNED FOR SUCH USE, THE PURCHASER SHALL USE PRODUCTS AT PURCHASER'S SOLE RISK, EVEN IF ST HAS BEEN INFORMED IN WRITING OF SUCH USAGE, UNLESS A PRODUCT IS EXPRESSLY DESIGNATED BY ST AS BEING INTENDED FOR "AUTOMOTIVE, AUTOMOTIVE SAFETY OR MEDICAL" INDUSTRY DOMAINS ACCORDING TO ST PRODUCT DESIGN SPECIFICATIONS. PRODUCTS FORMALLY ESCC, QML OR JAN QUALIFIED ARE DEEMED SUITABLE FOR USE IN AEROSPACE BY THE CORRESPONDING GOVERNMENTAL AGENCY.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.

ST and the ST logo are trademarks or registered trademarks of ST in various countries.

Information in this document supersedes and replaces all information previously supplied.

The ST logo is a registered trademark of STMicroelectronics. All other names are the property of their respective owners.
