# PIC24FV16KM204 FAMILY

## General Purpose, 16-Bit Flash Microcontrollers with XLP Technology Data Sheet

### Analog Peripheral Features

- Up to Two 8-Bit Digital-to-Analog Converters (DACs):
  - Soft Reset disable function allows DAC to retain its output value through non-$V_{DD}$ Resets
  - Support for Idle mode
  - Support for left and right justified input data
- Two Operational Amplifiers (Op Amps):
  - Differential inputs
  - Selectable power/speed levels:
    - Low power/low speed
    - High power/high speed
- Up to 22-Channel, 10/12-Bit Analog-to-Digital Converter:
  - 100k samples/second at 12-bit conversion rate (single Sample-and-Hold)
  - Auto-scan with Threshold Detect
  - Can operate during Sleep
  - Dedicated band gap reference and temperature sensor input
- Up to Three Rail-to-Rail Analog Comparators:
  - Programmable reference voltage for comparators
  - Band gap reference input
  - Flexible input multiplexing
  - Low-power or high-speed selection options
- Charge Time Measurement Unit (CTMU):
  - Capacitive measurement, up to 22 channels
  - Time measurement down to 200 ps resolution
  - Up to 16 external Trigger pairs
- Internal Temperature Sensor with Dedicated A/D Converter Input

### High-Performance RISC CPU

- Modified Harvard Architecture
- Operating Speed:
  - DC – 32 MHz clock input
  - 16 MIPS at 32 MHz clock input
- 8 MHz Internal Oscillator:
  - 4x PLL option
  - Multiple clock divide options
  - Fast start-up
- 17-Bit x 17-Bit Single-Cycle Hardware Fractional/Integer Multiplier
- 32-Bit by 16-Bit Hardware Divider
- 16 x 16-Bit Working Register Array
- C Compiler Optimized Instruction Set Architecture
- 24-Bit-Wide Instructions
- 16-Bit-Wide Data Path
- Linear Program Memory Addressing, up to 6 Mbytes
- Linear Data Memory Addressing, up to 64 Kbytes
- Two Address Generation Units (AGUs) for Separate Read and Write Addressing of Data Memory

### Multiple/Single Capture Compare Peripheral (MCCP/SCCP) Features

- 16 or 32-Bit Time Base
- 16 or 32-Bit Capture:
  - 4-deep capture buffer
- 16 or 32-Bit Compare:
  - Single Edge Compare modes
  - Dual Edge Compare/PWM modes
  - Center-Aligned Compare mode
  - Variable Frequency Pulse mode
- Single Output Steerable mode (MCCP only)
- Brush DC Forward and Reverse modes (MCCP only)
- Half-Bridge with Dead-Time Delay (MCCP only)
- Push-Pull PWM mode (MCCP only)
- Auto-Shutdown with Programmable Source and Shutdown State
- Programmable Output Polarity

## Peripheral Features

- High-Current Sink/Source, 18 mA/18 mA All Ports
- Independent Ultra Low-Power, 32 kHz Timer Oscillator
- Up to Two Master Synchronous Serial Ports (MSSPs) with SPI and I$^2$C™ modes:
  In SPI mode:
  - User-configurable SCKx and SDOx pin outputs
  - Daisy-chaining of SPI slave devices
  In I$^2$C mode:
  - Serial clock synchronization (clock stretching)
  - Bus collision detection and will arbitrate accordingly
  - Support for 16-bit read/write interface
- Up to Two Enhanced Addressable UARTs:
  - LIN/J2602 bus support (auto-wake-up, Auto-Baud Detect, Break character support)
  - High and low speed (SCI)
  - IrDA® mode (hardware encoder/decoder function)
- Two External Interrupt Pins
- Hardware Real-Time Clock and Calendar (RTCC)
- Configurable Reference Clock Output (REFO)
- Two Configurable Logic Cells (CLC)
- Up to Two Single Output Capture/Compare/PWM (SCCP) modules and up to Three Multiple Output Capture/Compare/PWM (MCCP) modules
## Special Microcontroller Features

- Wide Operating Voltage Range Options:
  - 1.8V to 3.6V (PIC24F devices)
  - 2.0V to 5.0V (PIC24FV devices)
- Selectable Power Management modes:
  - Idle: CPU shuts down, allowing for significant power reduction
  - Sleep: CPU and peripherals shut down for substantial power reduction and fast wake-up
  - Retention Sleep mode: PIC24FV devices can enter Sleep mode, employing the Retention Regulator, further reducing power consumption
  - Doze: CPU can run at a lower frequency than peripherals, a user-programmable feature
  - Alternate Clock modes allow on-the-fly switching to a lower clock speed for selective power reduction
- Fail-Safe Clock Monitor:
  - Detects clock failure and switches to on-chip, low-power RC Oscillator
- Ultra Low-Power Wake-up Pin Provides an External Trigger for Wake from Sleep
- 10,000 Erase/Write Cycle Endurance Flash Program Memory, Typical
- 100,000 Erase/Write Cycle Endurance Data EEPROM, Typical
- Flash and Data EEPROM Data Retention: 20 Years Minimum
- Self-Programmable under Software Control
- Power-on Reset (POR), Power-up Timer (PWRT) and Oscillator Start-up Timer (OST)
- Watchdog Timer (WDT) with its Own On-Chip RC Oscillator for Reliable Operation
- On-Chip Regulator for 5V Operation
- Selectable Windowed WDT Feature
- Selectable Oscillator Options including:
  - 4x Phase Locked Loop (PLL)
- 8 MHz (FRC) Internal RC Oscillator:
  - HS/EC, High-Speed Crystal/Resonator Oscillator or External Clock
- In-Circuit Serial Programming™ (ICSP™) and In-Circuit Emulation (ICE) – via Two Pins
- In-Circuit Debugging
- Programmable High/Low-Voltage Detect (HLVD) module
- Programmable Brown-out Reset (BOR):
  - Software enable feature
  - Configurable shutdown in Sleep
  - Auto-configures power mode and sensitivity based on device operating speed
  - LPBOR available for re-arming of the POR

## Table of Contents

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@microchip.com**. We welcome your feedback.

### Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

> **http://www.microchip.com**

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

### Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

*   Microchip's Worldwide Web site; **http://www.microchip.com**
*   Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

### Customer Notification System

Register on our web site at **www.microchip.com** to receive the most current information on all of our products.

**NOTES:**

## 1.0    DEVICE OVERVIEW

This document contains device-specific information for the following devices:

- PIC24FV08KM101
- PIC24FV08KM102
- PIC24FV16KM102
- PIC24FV16KM104
- PIC24FV08KM202
- PIC24FV08KM204
- PIC24FV16KM202
- PIC24FV16KM204

- PIC24F08KM101
- PIC24F08KM102
- PIC24F16KM102
- PIC24F16KM104
- PIC24F08KM202
- PIC24F08KM204
- PIC24F16KM202
- PIC24F16KM204

The PIC24FV16KM204 family introduces many new analog features to the extreme low-power Microchip devices. This is a 16-bit microcontroller family with a broad peripheral feature set and enhanced computational performance. This family also offers a new migration option for those high-performance applications which may be outgrowing their 8-bit platforms, but do not require the numerical processing power of a Digital Signal Processor (DSC).

## 1.1    Core Features

### 1.1.1    16-BIT ARCHITECTURE

Central to all PIC24F devices is the 16-bit modified Harvard architecture, first introduced with Microchip's dsPIC® Digital Signal Controllers. The PIC24F CPU core offers a wide range of enhancements, such as:

- 16-bit data and 24-bit address paths with the ability to move information between data and memory spaces
- Linear Addressing of up to 16 Mbytes (program space) and 16 Kbytes (data)
- A 16-element working register array with built-in software stack support
- A 17 x 17 hardware multiplier with support for integer math
- Hardware support for 32-bit by 16-bit division
- An instruction set that supports multiple addressing modes and is optimized for high-level languages, such as C
- Operational performance up to 16 MIPS

### 1.1.2    POWER-SAVING TECHNOLOGY

All of the devices in the PIC24FV16KM204 family incorporate a range of features that can significantly reduce power consumption during operation. Key features include:

- On-the-Fly Clock Switching, to allow the device clock to be changed under software control to the Timer1 source or the internal, low-power RC Oscillator during operation, allowing users to incorporate power-saving ideas into their software designs.
- Doze Mode Operation, when timing-sensitive applications, such as serial communications, require the uninterrupted operation of peripherals, the CPU clock speed can be selectively reduced, allowing incremental power savings without missing a beat.
- Instruction-Based Power-Saving Modes, to allow the microcontroller to suspend all operations or selectively shut down its core while leaving its peripherals active with a single instruction in software.

### 1.1.3    OSCILLATOR OPTIONS AND FEATURES

The PIC24FV16KM204 family offers five different oscillator options, allowing users a range of choices in developing application hardware. These include:

- Two Crystal modes using crystals or ceramic resonators.
- Two External Clock (EC) modes offering the option of a divide-by-2 clock output.
- Two Fast Internal Oscillators (FRCs), one with a nominal 8 MHz output and the other with a nominal 500 kHz output. These outputs can also be divided under software control to provide clock speed as low as 31 kHz or 2 kHz.
- A Phase Locked Loop (PLL) frequency multiplier, available to the external oscillator modes and the 8 MHz FRC Oscillator, which allows clock speeds of up to 32 MHz.
- A separate internal RC Oscillator (LPRC) with a fixed 31 kHz output, which provides a low-power option for timing-insensitive applications.

The internal oscillator block also provides a stable reference source for the Fail-Safe Clock Monitor (FSCM). This option constantly monitors the main clock source against a reference signal provided by the internal oscillator and enables the controller to switch to the internal oscillator, allowing for continued low-speed operation or a safe application shutdown.

## 1.1.4    EASY MIGRATION

The PIC24FV16KM204 family devices have two variants. The KM20X variant provides the full feature set of the device, while the KM10X offers a reduced peripheral set, allowing for the balance of features and cost (refer to Table 1-1). Both variants allow for a smooth migration path as applications grow and evolve.

The consistent pinout scheme used throughout the entire family also helps in migrating to the next larger device. This is true when moving between devices with the same pin count, different die variants, or even moving from 20-pin or 28-pin devices to 44-pin/48-pin devices.

The PIC24F family is pin compatible with devices in the dsPIC33 family, and shares some compatibility with the pinout schema for PIC18 and dsPIC30. This extends the ability of applications to grow from the relatively simple to the powerful and complex, yet still selecting a Microchip device.

## 1.2    Other Special Features

- Communications: The PIC24FV16KM204 family incorporates a range of serial communication peripherals to handle a range of application requirements. There is an MSSP module which implements both SPI and I$^2$C™ protocols, and supports both Master and Slave modes of operation for each. Devices also include one of two UARTs with built-in IrDA® encoders/decoders.
- Analog Features: Select members of the PIC24FV16KM204 family include two 8-bit Digital-to-Analog Converters which offer support in Idle mode, and left and right justified input data, as well as up to two operational amplifiers with selectable power and speed modes.
- Real-Time Clock/Calendar (RTCC): This module implements a full-featured clock and calendar with alarm functions in hardware, freeing up timer resources and program memory space for use of the core application.
- 12-Bit A/D Converter: This module incorporates programmable acquisition time, allowing for a channel to be selected and a conversion to be initiated without waiting for a sampling period, and faster sampling speed. The 16-deep result buffer can be used either in Sleep, to reduce power, or in Active mode to improve throughput.
- Charge Time Measurement Unit (CTMU) Interface: The PIC24FV16KM204 family includes the new CTMU interface module, which can be used for capacitive touch sensing, proximity sensing, and also for precision time measurement and pulse generation. The CTMU can also be connected to the operational amplifiers to provide active guarding, which provides increased robustness in the presence of noise in capacitive touch applications.

## 1.3    Details on Individual Family Members

Devices in the PIC24FV16KM204 family are available in 20-pin, 28-pin, 44-pin and 48-pin packages. The general block diagram for all devices is shown in Figure 1-1.

Members of the PIC24FV16KM204 family are available as both standard and high-voltage devices. High-voltage devices, designated with an "FV" in the part number (such as PIC24FV16KM204), accommodate an operating V$_{DD}$ range of 2.0V to 5.5V and have an on-board voltage regulator that powers the core. Peripherals operate at V$_{DD}$.

Standard devices, designated by "F" (such as PIC24F16KM204), function over a lower V$_{DD}$ range of 1.8V to 3.6V. These parts do not have an internal regulator, and both the core and peripherals operate directly from V$_{DD}$.

The PIC24FV16KM204 family may be thought of as two different device groups, both offering slightly different sets of features. These differ from each other in multiple ways:

- The size of the Flash program memory
- The number of external analog channels available
- The number of Digital-to-Analog Converters
- The number of operational amplifiers
- The number of analog comparators
- The presence of a Real-Time Clock and Calendar (RTCC)
- The number and type of CCP modules (i.e., MCCP vs. SCCP)
- The number of serial communication modules (both MSSPs and UARTs)
- The number of Configurable Logic Cell (CLC) modules

The general differences between the different sub-families are shown in Table 1-1 and Table 1-2.

A list of the pin features available on the PIC24FV16KM204 family devices, sorted by function, is provided in Table 1-5.

**TABLE 1-1:** DEVICE FEATURES FOR THE PIC24F16KM204 FAMILY

| Features | PIC24F16KM204 | PIC24F08KM204 | PIC24F16KM202 | PIC24F08KM202 |
|---|---|---|---|---|
| Operating Frequency | DC-32 MHz | | | |
| Program Memory (bytes) | 16K | 8K | 16K | 8K |

| Instruction Set | 76 Base Instructions, Multiple Addressing Mode Variations | | | |
| Packages | 44-Pin QFN/TQFP, 48-Pin UQFN | 28-Pin SPDIP/SSOP/SOIC/QFN | | 20-Pin SOIC/SSOP/PDIP |

**TABLE 1-3: DEVICE FEATURES FOR THE PIC24FV16KM204 FAMILY**

| Features | PIC24FV16KM204 | PIC24FV08KM204 | PIC24FV16KM202 | PIC24FV08KM202 |
|---|---|---|---|---|
| Operating Frequency | DC-32 MHz | | | |
| Program Memory (bytes) | 16K | 8K | 16K | 8K |
| Program Memory (instructions) | 5632 | 2816 | 5632 | 2816 |
| Data Memory (bytes) | 2048 | | | |
| Data EEPROM Memory (bytes) | 512 | | | |
| Interrupt Sources (soft vectors/NMI traps) | 40 (36/4) | | | |
| Voltage Range | 2.0-5.5V | | | |
| I/O Ports | PORTA<11:7,5:0> PORTB<15:0> PORTC<9:0> | | PORTA<7,5:0> PORTB<15:0> | |
| Total I/O Pins | 37 | | 23 | |
| Timers | 11 (One 16-bit timer, five MCCPs/SCCPs with up to two 16/32 timers each) | | | |
| Capture/Compare/PWM modules MCCP SCCP | 3 2 | | | |
| Serial Communications MSSP UART | 2 2 | | | |
| Input Change Notification Interrupt | 36 | | 22 | |
| 12-Bit Analog-to-Digital Module (input channels) | 22 | | 19 | |
| Analog Comparators | 3 | | | |
| 8-Bit Digital-to-Analog Converters | 2 | | | |
| Operational Amplifiers | 2 | | | |
| Charge Time Measurement Unit (CTMU) | Yes | | | |
| Real-Time Clock and Calendar (RTCC) | Yes | | | |
| Configurable Logic Cell (CLC) | 2 | | | |
| Resets (and delays) | POR, BOR, RESET Instruction, MCLR, WDT, Illegal Opcode, REPEAT Instruction, Hardware Traps, Configuration Word Mismatch (PWRT, OST, PLL Lock) | | | |
| Instruction Set | 76 Base Instructions, Multiple Addressing Mode Variations | | | |
| Packages | 44-Pin QFN/TQFP, 48-Pin UQFN | | 28-Pin SPDIP/SSOP/SOIC/QFN | |

# PIC24FV16KM204 FAMILY

**TABLE 1-4:** DEVICE FEATURES FOR THE PIC24FV16KM104 FAMILY

| Features | PIC24FV16KM104 | PIC24FV16KM102 | PIC24FV08KM102 | PIC24FV08KM101 |
|---|---|---|---|---|
| Operating Frequency | DC-32 MHz | | | |
| Program Memory (bytes) | 16K | 16K | 8K | 8K |
| Program Memory (instructions) | 5632 | 5632 | 2816 | 2816 |
| Data Memory (bytes) | 1024 | | | |
| Data EEPROM Memory (bytes) | 512 | | | |
| Interrupt Sources (soft vectors/NMI traps) | 25 (21/4) | | | |
| Voltage Range | 2.0-5.5V | | | |
| I/O Ports | PORTA<11:7,5:0> PORTB<15:0> PORTC<9:0> | PORTA<7,5:0> PORTB<15:0> | | PORTA<5:0> PORTB<15:12,9:7, 4,2:0> |
| Total I/O Pins | 37 | 23 | | 17 |
| Timers | 5 (One 16-bit timer, two MCCPs/SCCPs with up to two 16/32 timers each) | | | |
| Capture/Compare/PWM modules MCCP SCCP | 1 1 | | | |
| Serial Communications MSSP UART | 1 1 | | | |
| Input Change Notification Interrupt | 36 | 22 | | 16 |
| 12-Bit Analog-to-Digital Module (input channels) | 22 | 19 | | 16 |
| Analog Comparators | 1 | | | |
| 8-Bit Digital-to-Analog Converters | — | | | |
| Operational Amplifiers | — | | | |
| Charge Time Measurement Unit (CTMU) | Yes | | | |
| Real-Time Clock and Calendar (RTCC) | — | | | |
| Configurable Logic Cell (CLC) | 1 | | | |
| Resets (and delays) | POR, BOR, RESET Instruction, $\overline{\text{MCLR}}$, WDT, Illegal Opcode, REPEAT Instruction, Hardware Traps, Configuration Word Mismatch (PWRT, OST, PLL Lock) | | | |
| Instruction Set | 76 Base Instructions, Multiple Addressing Mode Variations | | | |
| Packages | 44-Pin QFN/TQFP, 48-Pin UQFN | 28-Pin SPDIP/SSOP/SOIC/QFN | | 20-Pin SOIC/SSOP/PDIP |

**FIGURE 1-1:** **PIC24FXXXXX FAMILY GENERAL BLOCK DIAGRAMS**

**Note 1:** All pins or features are not implemented on all device pinout configurations. See Table 1-5 for I/O port pin descriptions.

# PIC24FV16KM204 FAMILY

## 2.0 GUIDELINES FOR GETTING STARTED WITH 16-BIT MICROCONTROLLERS

### 2.1 Basic Connection Requirements

Getting started with the PIC24FV16KM204 family of 16-bit microcontrollers requires attention to a minimal set of device pin connections before proceeding with development.

The following pins must always be connected:

• All V$_{DD}$ and V$_{SS}$ pins
  (see **Section 2.2 "Power Supply Pins"**)

• All AV$_{DD}$ and AV$_{SS}$ pins, regardless of whether or not the analog device features are used
  (see **Section 2.2 "Power Supply Pins"**)

• MCLR pin
  (see **Section 2.3 "Master Clear (MCLR) Pin"**)

• V$_{CAP}$ pins
  (see **Section 2.4 "Voltage Regulator Pin (VCAP)"**)

These pins must also be connected if they are being used in the end application:

• PGECx/PGEDx pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes
  (see **Section 2.5 "ICSP Pins"**)

• OSCI and OSCO pins when an external oscillator source is used
  (see **Section 2.6 "External Oscillator Pins"**)

Additionally, the following pins may be required:

• V$_{REF}$+/V$_{REF}$- pins are used when external voltage reference for analog modules is implemented

> **Note:** The AV$_{DD}$ and AV$_{SS}$ pins must always be connected, regardless of whether any of the analog modules are being used.

The minimum mandatory connections are shown in Figure 2-1.

**FIGURE 2-1: RECOMMENDED MINIMUM CONNECTIONS**

**Key (all values are recommendations):**

C1 through C6: 0.1 µF, 20V ceramic

C7: 10 µF, 16V tantalum or ceramic

R1: 10 kΩ

R2: 100Ω to 470Ω

**Note 1:** See **Section 2.4 "Voltage Regulator Pin (VCAP)"** for an explanation of V$_{CAP}$ pin connections.
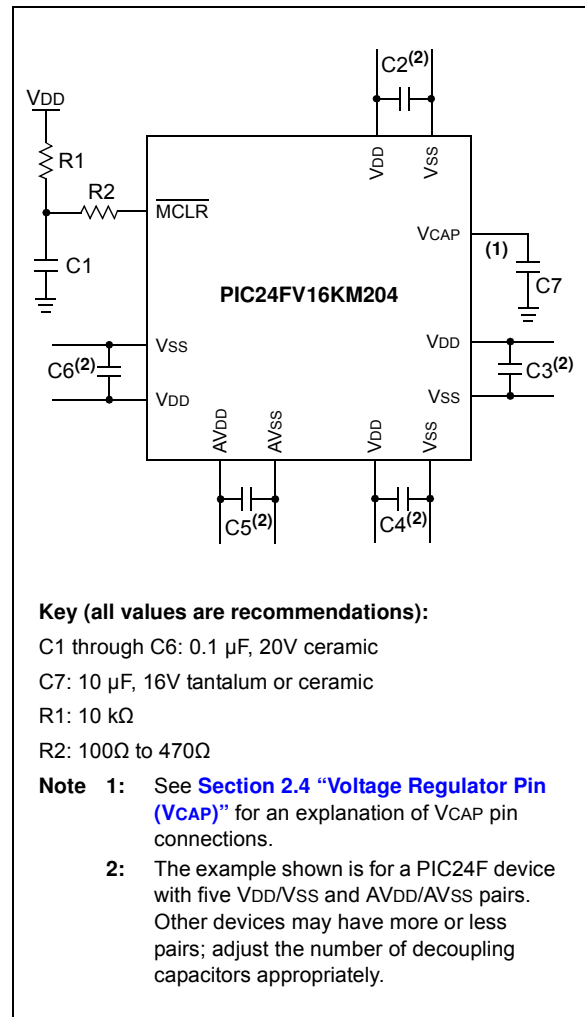

**2:** The example shown is for a PIC24F device with five V$_{DD}$/V$_{SS}$ and AV$_{DD}$/AV$_{SS}$ pairs. Other devices may have more or less pairs; adjust the number of decoupling capacitors appropriately.

## 2.2 Power Supply Pins

### 2.2.1 DECOUPLING CAPACITORS

The use of decoupling capacitors on every pair of power supply pins, such as $V_{DD}$, $V_{SS}$, $AV_{DD}$ and $AV_{SS}$, is required.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** A 0.1 µF (100 nF), 10-20V capacitor is recommended. The capacitor should be a low-ESR device, with a resonance frequency in the range of 200 MHz and higher. Ceramic capacitors are recommended.

- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is no greater than 0.25 inch (6 mm).

- **Handling high-frequency noise:** If the board is experiencing high-frequency noise (upward of tens of MHz), add a second ceramic type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 µF to 0.001 µF. Place this second capacitor next to each primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible (e.g., 0.1 µF in parallel with 0.001 µF).

- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum, thereby reducing PCB trace inductance.

### 2.2.2 TANK CAPACITORS

On boards with power traces running longer than six inches in length, it is suggested to use a tank capacitor for integrated circuits, including microcontrollers, to supply a local power source. The value of the tank capacitor should be determined based on the trace resistance that connects the power supply source to the device, and the maximum current drawn by the device in the application. In other words, select the tank capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7 µF to 47 µF.

## 2.3 Master Clear ($\overline{MCLR}$) Pin

The $\overline{MCLR}$ pin provides two specific device functions: device Reset, and device programming and debugging. If programming and debugging are not required in the end application, a direct connection to $V_{DD}$ may be all that is required. The addition of other components, to help increase the application's resistance to spurious Resets from voltage sags, may be beneficial. A typical configuration is shown in Figure 2-1. Other circuit designs may be implemented, depending on the application's requirements.

During programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the $\overline{MCLR}$ pin. Consequently, specific voltage levels ($V_{IH}$ and $V_{IL}$) and fast signal transitions must not be adversely affected. Therefore, specific values of R1 and C1 will need to be adjusted based on the application and PCB requirements. For example, it is recommended that the capacitor, C1, be isolated from the $\overline{MCLR}$ pin during programming and debugging operations by using a jumper (Figure 2-2). The jumper is replaced for normal run-time operations.

Any components associated with the $\overline{MCLR}$ pin should be placed within 0.25 inch (6 mm) of the pin.

**FIGURE 2-2: EXAMPLE OF $\overline{MCLR}$ PIN CONNECTIONS**

**Note 1:** R1 ≤ 10 kΩ is recommended. A suggested starting value is 10 kΩ. Ensure that the $\overline{MCLR}$ pin $V_{IH}$ and $V_{IL}$ specifications are met.

**2:** R2 ≤ 470Ω will limit any current flowing into $\overline{MCLR}$ from the external capacitor, C, in the event of $\overline{MCLR}$ pin breakdown, due to Electrostatic Discharge (ESD) or Electrical Overstress (EOS). Ensure that the $\overline{MCLR}$ pin $V_{IH}$ and $V_{IL}$ specifications are met.
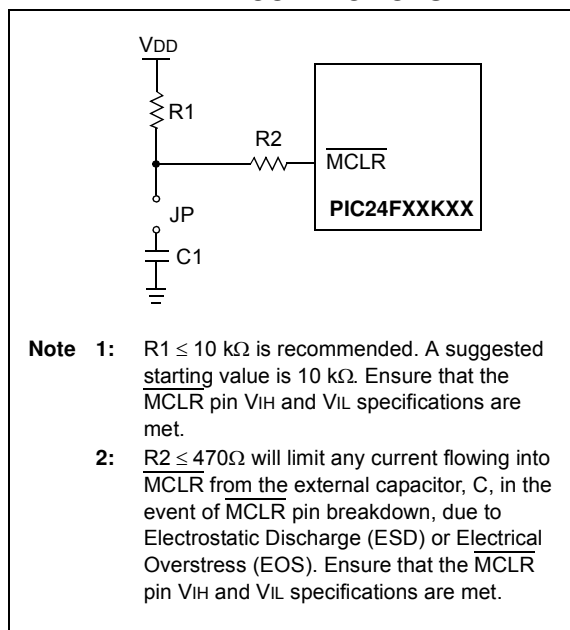

## 2.4 Voltage Regulator Pin (VCAP)

> **Note:** This section applies only to PIC24FV16KM devices with an on-chip voltage regulator.

Some of the PIC24FV16KM devices have an internal voltage regulator. These devices have the voltage regulator output brought out on the VCAP pin. On the PIC24F K devices with regulators, a low-ESR (< 5Ω) capacitor is required on the VCAP pin to stabilize the voltage regulator output. The VCAP pin must not be connected to VDD and must use a capacitor of 10 µF connected to ground. The type can be ceramic or tantalum. Suitable examples of capacitors are shown in Table 2-1. Capacitors with equivalent specifications can be used.

Designers may use Figure 2-3 to evaluate ESR equivalence of candidate devices.

The placement of this capacitor should be close to VCAP. It is recommended that the trace length not exceed 0.25 inch (6 mm). Refer to **Section 27.0 "Electrical Characteristics"** for additional information.

Refer to **Section 27.0 "Electrical Characteristics"** for information on VDD and VDDCORE.

**FIGURE 2-3:** **FREQUENCY vs. ESR PERFORMANCE FOR SUGGESTED VCAP**

**Note:** Typical data measurement at +25°C, 0V DC bias.
**TABLE 2-1: SUITABLE CAPACITOR EQUIVALENTS**

| Make | Part # | Nominal Capacitance | Base Tolerance | Rated Voltage | Temp. Range |
|---|---|---|---|---|---|
| TDK | C3216X7R1C106K | 10 µF | ±10% | 16V | -55 to +125ºC |
| TDK | C3216X5R1C106K | 10 µF | ±10% | 16V | -55 to +85ºC |
| Panasonic | ECJ-3YX1C106K | 10 µF | ±10% | 16V | -55 to +125ºC |
| Panasonic | ECJ-4YB1C106K | 10 µF | ±10% | 16V | -55 to +85ºC |
| Murata | GRM32DR71C106KA01L | 10 µF | ±10% | 16V | -55 to +125ºC |
| Murata | GRM31CR61C106KC31L | 10 µF | ±10% | 16V | -55 to +85ºC |

### 2.4.1 CONSIDERATIONS FOR CERAMIC CAPACITORS

In recent years, large value, low-voltage, surface-mount ceramic capacitors have become very cost effective in sizes up to a few tens of microfarad. The low-ESR, small physical size and other properties make ceramic capacitors very attractive in many types of applications.

Ceramic capacitors are suitable for use with the internal voltage regulator of this microcontroller. However, some care is needed in selecting the capacitor to ensure that it maintains sufficient capacitance over the intended operating range of the application.

Typical low-cost, 10 µF ceramic capacitors are available in X5R, X7R and Y5V dielectric ratings (other types are also available, but are less common). The initial tolerance specifications for these types of capacitors are often specified as ±10% to ±20% (X5R and X7R), or -20%/+80% (Y5V). However, the effective capacitance that these capacitors provide in an application circuit will also vary based on additional factors, such as the applied DC bias voltage and the temperature. The total in-circuit tolerance is, therefore, much wider than the initial tolerance specification.

The X5R and X7R capacitors typically exhibit satisfactory temperature stability (ex: ±15% over a wide temperature range, but consult the manufacturer's data sheets for exact specifications). However, Y5V capacitors typically have extreme temperature tolerance specifications of +22%/-82%. Due to the extreme temperature tolerance, a 10 µF nominal rated Y5V type capacitor may not deliver enough total capacitance to meet minimum internal voltage regulator stability and transient response requirements. Therefore, Y5V capacitors are not recommended for use with the internal regulator if the application must operate over a wide temperature range.

In addition to temperature tolerance, the effective capacitance of large value ceramic capacitors can vary substantially, based on the amount of DC voltage applied to the capacitor. This effect can be very significant, but is often overlooked or is not always documented.

A typical DC bias voltage vs. capacitance graph for X7R type capacitors is shown in Figure 2-4.

**FIGURE 2-4: DC BIAS VOLTAGE vs. CAPACITANCE CHARACTERISTICS**

When selecting a ceramic capacitor to be used with the internal voltage regulator, it is suggested to select a high-voltage rating, so that the operating voltage is a small percentage of the maximum rated capacitor voltage. For example, choose a ceramic capacitor rated at 16V for the 3.3V or 2.5V core voltage. Suggested capacitors are shown in Table 2-1.

## 2.5 ICSP Pins

The PGECx and PGEDx pins are used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of ohms, not to exceed 100Ω.

Pull-up resistors, series diodes, and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits, and pins, Voltage Input High ($V_{IH}$) and Voltage Input Low ($V_{IL}$) requirements.

For device emulation, ensure that the "Communication Channel Select" (i.e., PGECx/PGEDx pins), programmed into the device, matches the physical connections for the ICSP to the Microchip debugger/emulator tool.

For more information on available Microchip development tools connection requirements, refer to **Section 26.0 "Development Support"**.

## 2.6 External Oscillator Pins

Many microcontrollers have options for at least two oscillators: a high-frequency Primary Oscillator and a low-frequency Secondary Oscillator (refer to for **Section 9.0 "Oscillator Configuration"** details).

The oscillator circuit should be placed on the same side of the board as the device. Place the oscillator circuit close to the respective oscillator pins with no more than 0.5 inch (12 mm) between the circuit components and the pins. The load capacitors should be placed next to the oscillator itself, on the same side of the board.

Use a grounded copper pour around the oscillator circuit to isolate it from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed.

Layout suggestions are shown in Figure 2-5. In-line packages may be handled with a single-sided layout that completely encompasses the oscillator pins. With fine-pitch packages, it is not always possible to completely surround the pins and components. A suitable solution is to tie the broken guard sections to a mirrored ground layer. In all cases, the guard trace(s) must be returned to ground.

In planning the application's routing and I/O assignments, ensure that adjacent port pins and other signals, in close proximity to the oscillator, are benign (i.e., free of high frequencies, short rise and fall times, and other similar noise).

For additional information and design guidance on oscillator circuits, please refer to these Microchip Application Notes, available at the corporate web site (www.microchip.com):

## 2.7 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a logic low state. Alternatively, connect a 1 kΩ to 10 kΩ resistor to Vss on unused pins and drive the output to logic low.

**FIGURE 2-5: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT**
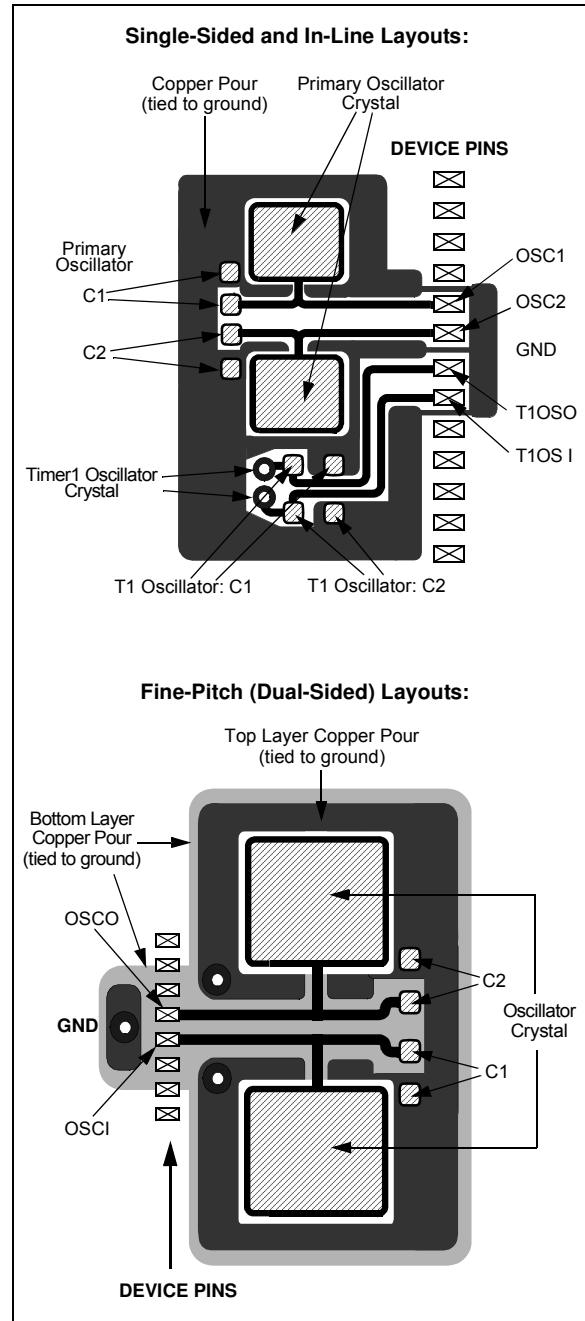

**NOTES:**

## 3.0 CPU

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the CPU, refer to the *"PIC24F Family Reference Manual"*, **"CPU"** (DS39703).

The PIC24F CPU has a 16-bit (data) modified Harvard architecture with an enhanced instruction set and a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M instructions of user program memory space. A single-cycle instruction prefetch mechanism is used to help maintain throughput and provides predictable execution. All instructions execute in a single cycle, with the exception of instructions that change the program flow, the double-word move (MOV.D) instruction and the table instructions. Overhead-free program loop constructs are supported using the REPEAT instructions, which are interruptible at any point.

PIC24F devices have sixteen, 16-bit working registers in the programmer's model. Each of the working registers can act as a data, address or address offset register. The 16th working register (W15) operates as a Software Stack Pointer (SSP) for interrupts and calls.

The upper 32 Kbytes of the Data Space (DS) memory map can optionally be mapped into program space at any 16K word boundary of either program memory or data EEPROM memory, defined by the 8-bit Program Space Visibility Page Address (PSVPAG) register. The program to Data Space mapping feature lets any instruction access program space as if it were Data Space.

The Instruction Set Architecture (ISA) has been significantly enhanced beyond that of the PIC18, but maintains an acceptable level of backward compatibility. All PIC18 instructions and addressing modes are supported, either directly, or through simple macros. Many of the ISA enhancements have been driven by compiler efficiency needs.

The core supports Inherent (no operand), Relative, Literal, Memory Direct and three groups of addressing modes. All modes support Register Direct and various Register Indirect modes. Each group offers up to seven addressing modes. Instructions are associated with predefined addressing modes depending upon their functional requirements.

For most instructions, the core is capable of executing a data (or program data) memory read, a working register (data) read, a data memory write and a program (instruction) memory read per instruction cycle. As a result, three parameter instructions can be supported, allowing trinary operations (i.e., A + B = C) to be executed in a single cycle.

A high-speed, 17-bit by 17-bit multiplier has been included to significantly enhance the core arithmetic capability and throughput. The multiplier supports Signed, Unsigned and Mixed mode, 16-bit by 16-bit or 8-bit by 8-bit integer multiplication. All multiply instructions execute in a single cycle.

The 16-bit ALU has been enhanced with integer divide assist hardware that supports an iterative non-restoring divide algorithm. It operates in conjunction with the REPEAT instruction looping mechanism and a selection of iterative divide instructions to support 32-bit (or 16-bit), divided by 16-bit integer signed and unsigned division. All divide operations require 19 cycles to complete but are interruptible at any cycle boundary.

The PIC24F has a vectored exception scheme with up to eight sources of non-maskable traps and up to 118 interrupt sources. Each interrupt source can be assigned to one of seven priority levels.

A block diagram of the CPU is illustrated in Figure 3-1.

## 3.1 Programmer's Model

Figure 3-2 displays the programmer's model for the PIC24F. All registers in the programmer's model are memory mapped and can be manipulated directly by instructions.

Table 3-1 provides a description of each register. All registers associated with the programmer's model are memory mapped.

**FIGURE 3-1:** **PIC24F CPU CORE BLOCK DIAGRAM**

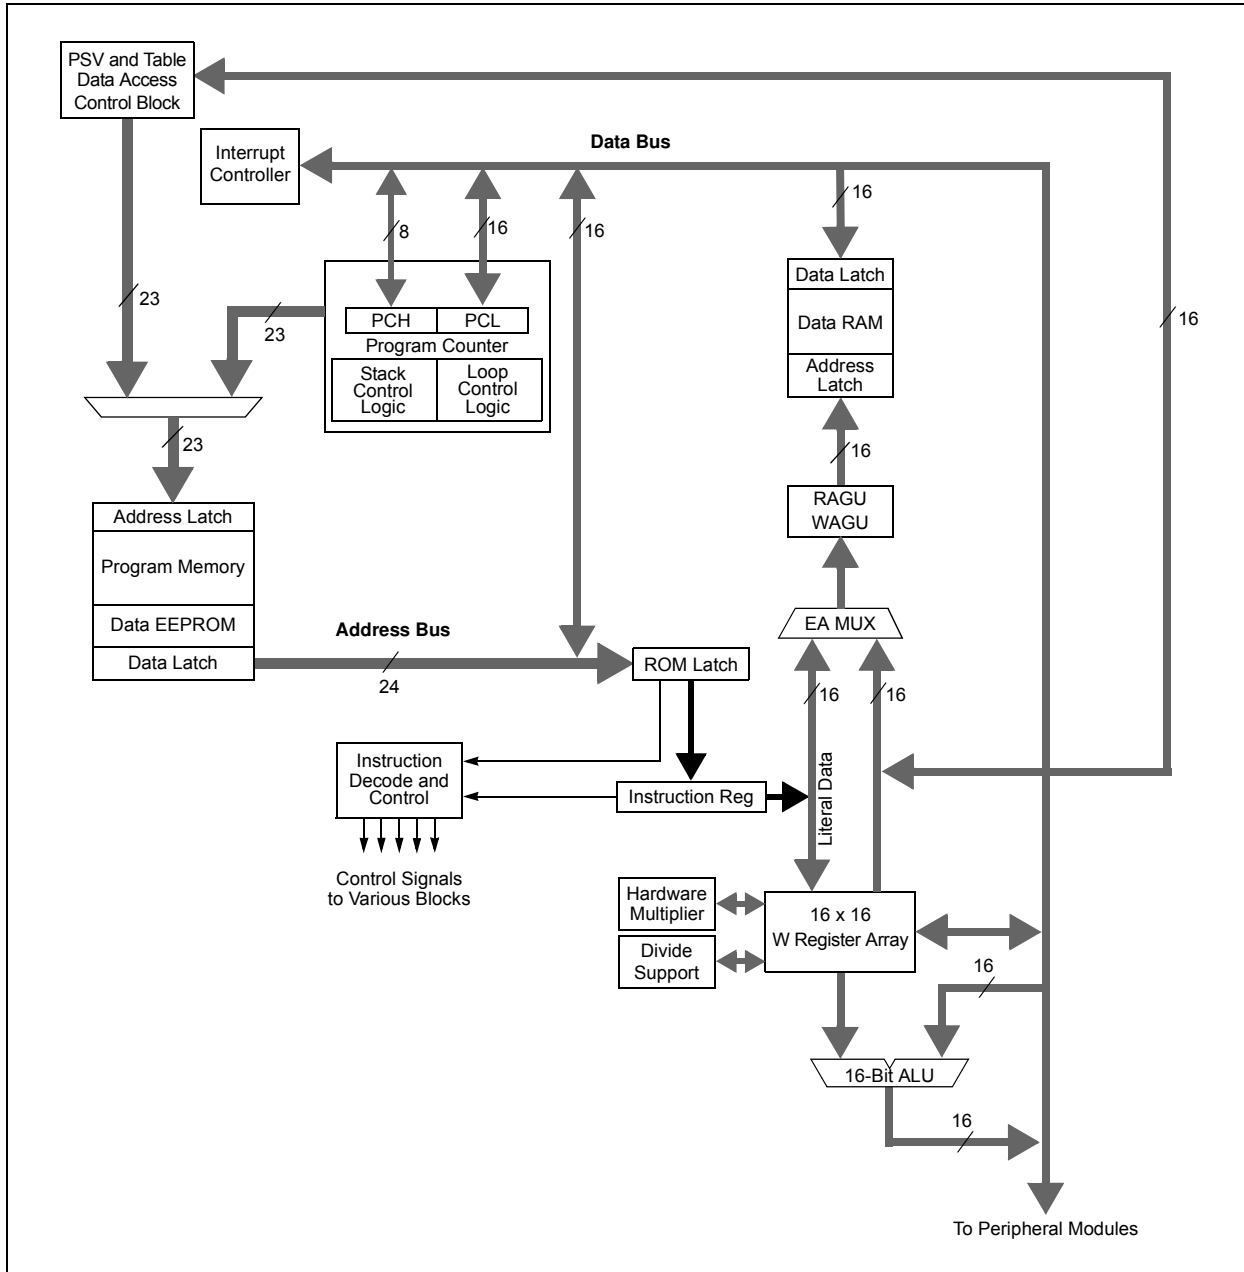

**TABLE 3-1:** **CPU CORE REGISTERS**

| Register(s) Name | Description |
|---|---|
| W0 through W15 | Working Register Array |
| PC | 23-Bit Program Counter |
| SR | ALU STATUS Register |
| SPLIM | Stack Pointer Limit Value Register |
| TBLPAG | Table Memory Page Address Register |
| PSVPAG | Program Space Visibility Page Address Register |
| RCOUNT | Repeat Loop Counter Register |
| CORCON | CPU Control Register |

**FIGURE 3-2: PROGRAMMER'S MODEL**

Registers or bits are shadowed for `PUSH.S` and `POP.S` instructions.
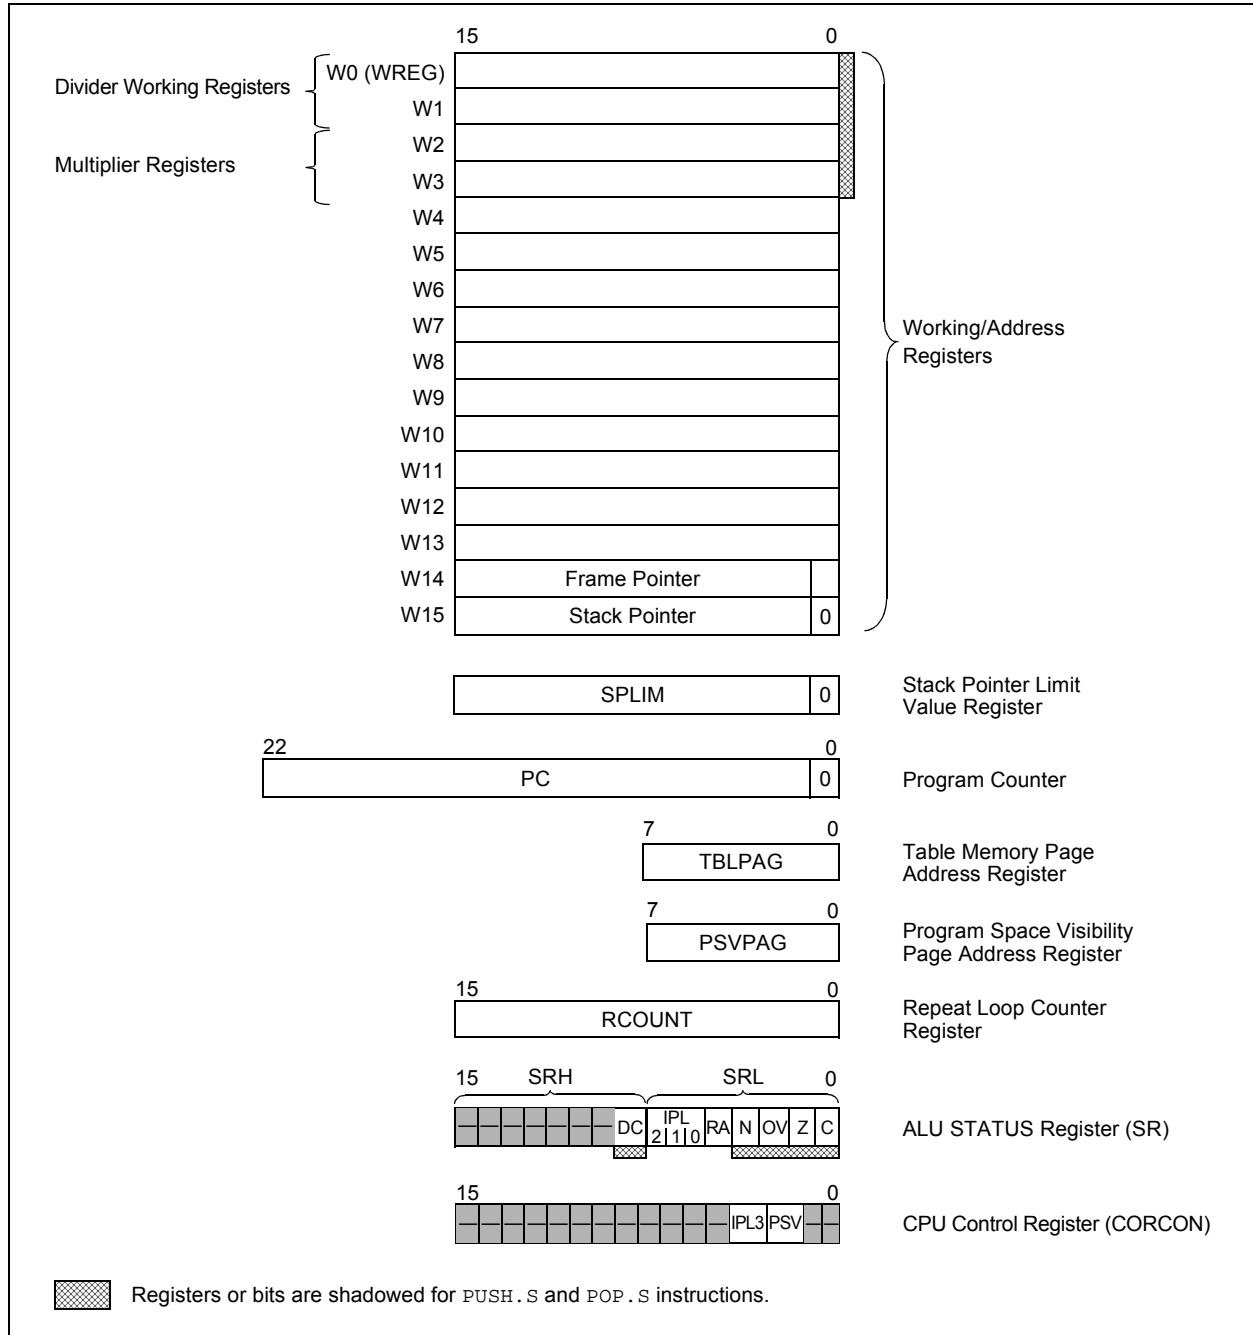

## 3.2 CPU Control Registers

### REGISTER 3-1: SR: ALU STATUS REGISTER

| U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | R/W-0, HSC |
|-----|-----|-----|-----|-----|-----|-----|------------|
| — | — | — | — | — | — | — | DC |
| bit 15 | | | | | | | bit 8 |

| R/W-0, HSC[1] | R/W-0, HSC[1] | R/W-0, HSC[1] | R-0, HSC | R/W-0, HSC | R/W-0, HSC | R/W-0, HSC | R/W-0, HSC |
|-----|-----|-----|-----|-----|-----|-----|------------|
| IPL2[2] | IPL1[2] | IPL0[2] | RA | N | OV | Z | C |
| bit 7 | | | | | | | bit 0 |

| Legend: | | HSC = Hardware Settable/Clearable bit | |
|---------|---|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 15-9 **Unimplemented:** Read as '0'

bit 8 **DC:** ALU Half Carry/Borrow bit
1 = A carry-out from the 4$^{th}$ low-order bit (for byte-sized data) or 8$^{th}$ low-order bit (for word-sized data) of the result occurred
0 = No carry-out from the 4$^{th}$ or 8$^{th}$ low-order bit of the result has occurred

bit 7-5 **IPL<2:0>:** CPU Interrupt Priority Level Status bits[1,2]
111 = CPU Interrupt Priority Level is 7 (15); user interrupts are disabled
110 = CPU Interrupt Priority Level is 6 (14)
101 = CPU Interrupt Priority Level is 5 (13)
100 = CPU Interrupt Priority Level is 4 (12)
011 = CPU Interrupt Priority Level is 3 (11)
010 = CPU Interrupt Priority Level is 2 (10)
001 = CPU Interrupt Priority Level is 1 (9)
000 = CPU Interrupt Priority Level is 0 (8)

bit 4 **RA:** REPEAT Loop Active bit
1 = REPEAT loop in progress
0 = REPEAT loop not in progress

bit 3 **N:** ALU Negative bit
1 = Result was negative
0 = Result was non-negative (zero or positive)

bit 2 **OV:** ALU Overflow bit
1 = Overflow occurred for signed (2's complement) arithmetic in this arithmetic operation
0 = No overflow has occurred

bit 1 **Z:** ALU Zero bit
1 = An operation, which effects the Z bit, has set it at some time in the past
0 = The most recent operation, which effects the Z bit, has cleared it (i.e., a non-zero result)

bit 0 **C:** ALU Carry/Borrow bit
1 = A carry-out from the Most Significant bit (MSb) of the result occurred
0 = No carry-out from the Most Significant bit (MSb) of the result occurred

**Note 1:** The IPLx Status bits are read-only when NSTDIS (INTCON1<15>) = 1.
**2:** The IPL<2:0> Status bits are concatenated with the IPL3 bit (CORCON<3>) to form the CPU Interrupt Priority Level (IPL). The value in parentheses indicates the IPL when IPL3 = 1.

**REGISTER 3-2: CORCON: CPU CONTROL REGISTER**

| U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 |
|-----|-----|-----|-----|-----|-----|-----|-----|
| — | — | — | — | — | — | — | — |
| bit 15 | | | | | | | bit 8 |

| U-0 | U-0 | U-0 | U-0 | R/C-0, HSC | R/W-0 | U-0 | U-0 |
|-----|-----|-----|-----|-----|-----|-----|-----|
| — | — | — | — | IPL3[1] | PSV | — | — |
| bit 7 | | | | | | | bit 0 |

| Legend: | | C = Clearable bit | HSC = Hardware Settable/Clearable bit |
|---------|--|-------------------|--------------------------------------|
| R = Readable bit | | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | | '1' = Bit is set | '0' = Bit is cleared          x = Bit is unknown |

bit 15-4    **Unimplemented:** Read as '0'

bit 3       **IPL3:** CPU Interrupt Priority Level Status bit[1]

        1 = CPU Interrupt Priority Level is greater than 7
        0 = CPU Interrupt Priority Level is 7 or less

bit 2       **PSV:** Program Space Visibility in Data Space Enable bit

        1 = Program space is visible in Data Space
        0 = Program space is not visible in Data Space

bit 1-0     **Unimplemented:** Read as '0'

**Note 1:** User interrupts are disabled when IPL3 = 1.

## 3.3    Arithmetic Logic Unit (ALU)

The PIC24F ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are 2's complement in nature. Depending on the operation, the ALU may affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array, or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

The PIC24F CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware division for 16-bit divisor.

### 3.3.1    MULTIPLIER

The ALU contains a high-speed, 17-bit x 17-bit multiplier. It supports unsigned, signed or mixed sign operation in several multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit signed
- 8-bit unsigned x 8-bit unsigned

### 3.3.2 DIVIDER

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

1. 32-bit signed/16-bit signed divide
2. 32-bit unsigned/16-bit unsigned divide
3. 16-bit signed/16-bit signed divide
4. 16-bit unsigned/16-bit unsigned divide

The quotient for all divide instructions ends up in W0 and the remainder in W1. Sixteen-bit signed and unsigned DIV instructions can specify any W register for both the 16-bit divisor (Wn), and any W register (aligned) pair (W(m + 1):Wm) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute.

### 3.3.3 MULTI-BIT SHIFT SUPPORT

The PIC24F ALU supports both single bit and single-cycle, multi-bit arithmetic and logic shifts. Multi-bit shifts are implemented using a shifter block, capable of performing up to a 15-bit arithmetic right shift, or up to a 15-bit left shift, in a single cycle. All multi-bit shift instructions only support Register Direct Addressing for both the operand source and result destination.

A full summary of instructions that use the shift operation is provided in Table 3-2.

**TABLE 3-2: INSTRUCTIONS THAT USE THE SINGLE AND MULTI-BIT SHIFT OPERATION**

| Instruction | Description |
|---|---|
| ASR | Arithmetic shift right source register by one or more bits. |
| SL | Shift left source register by one or more bits. |
| LSR | Logical shift right source register by one or more bits. |

© 2013 Microchip Technology Inc.

## 4.0 MEMORY ORGANIZATION

As with Harvard architecture devices, the PIC24F microcontrollers feature separate program and data memory space and busing. This architecture also allows the direct access of program memory from the Data Space (DS) during code execution.

## 4.1 Program Address Space

The program address memory space of the PIC24F devices is 4M instructions. The space is addressable by a 24-bit value derived from either the 23-bit Program Counter (PC) during program execution, or from a table operation or Data Space remapping, as described in **Section 4.3 "Interfacing Program and Data Memory Spaces"**.

The user access to the program memory space is restricted to the lower half of the address range (000000h to 7FFFFFh). The exception is the use of TBLRD/TBLWT operations, which use TBLPAG<7> to permit access to the Configuration bits and Device ID sections of the configuration memory space.

Memory maps for the PIC24FV16KM204 family of devices are displayed in Figure 4-1.

**FIGURE 4-1: PROGRAM SPACE MEMORY MAP FOR PIC24FXXXXX FAMILY DEVICES**

Note: Memory areas are not displayed to scale.
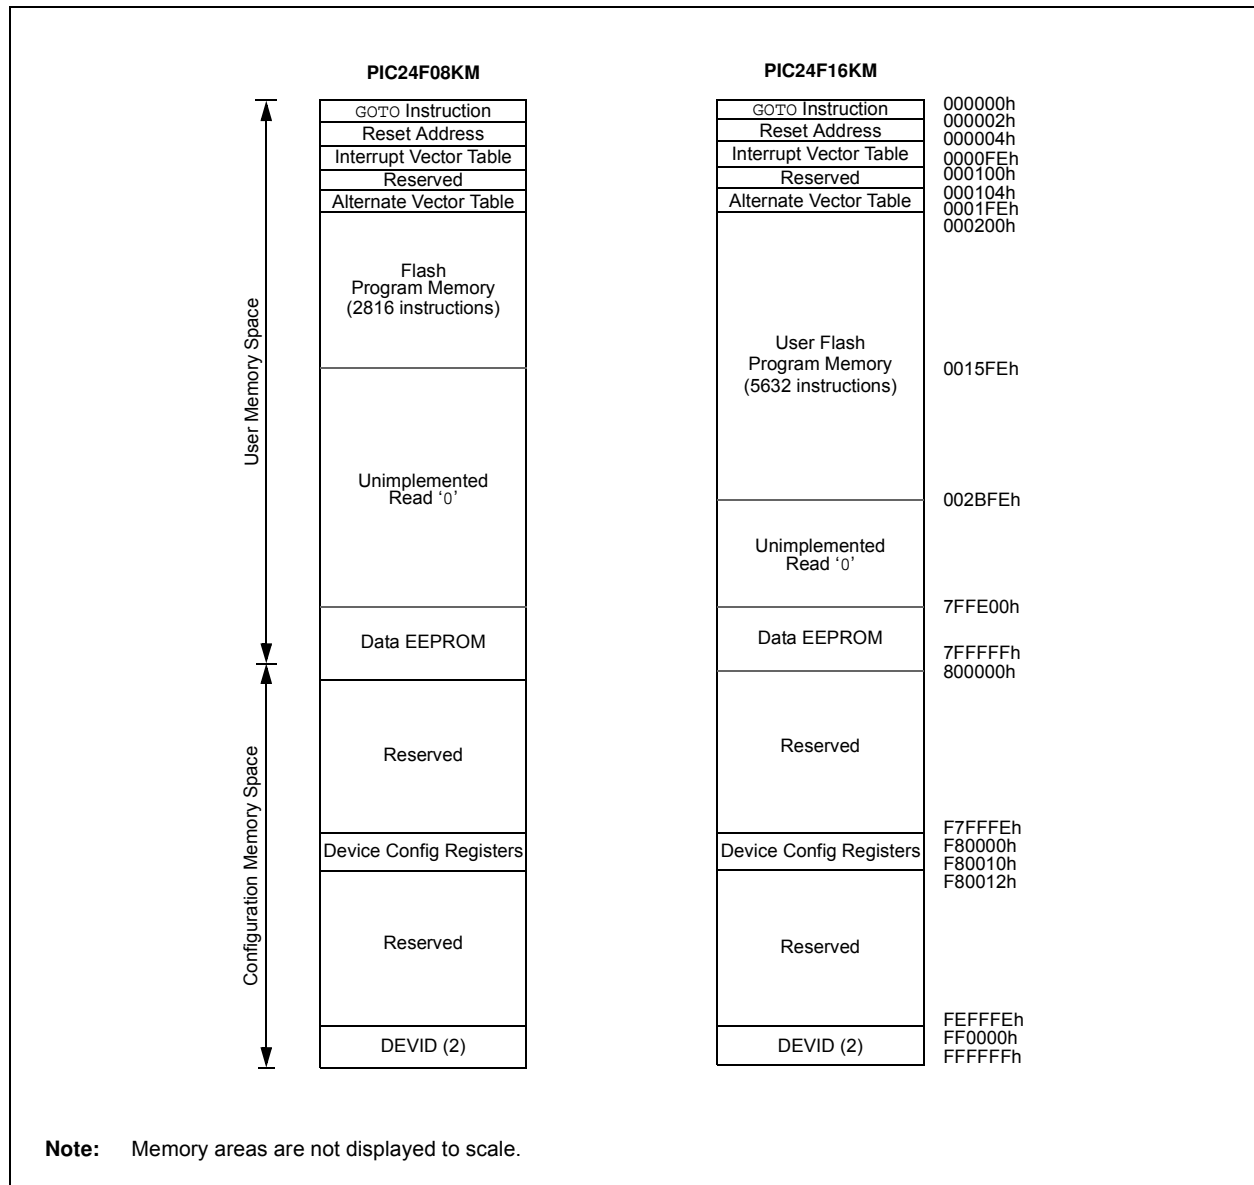

### 4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (Figure 4-2).

Program memory addresses are always word-aligned on the lower word, and addresses are incremented or decremented by two during code execution. This arrangement also provides compatibility with Data Memory Space Addressing and makes it possible to access data in the program memory space.

### 4.1.2 HARD MEMORY VECTORS

All PIC24F devices reserve the addresses between 00000h and 000200h for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user at 000000h with the actual address for the start of code at 000002h.

PIC24F devices also have two Interrupt Vector Tables, located from 000004h to 0000FFh, and 000104h to 0001FFh. These vector tables allow each of the many device interrupt sources to be handled by separate ISRs. **Section 8.1 "Interrupt Vector Table (IVT)"** discusses the Interrupt Vector Tables in more detail.

### 4.1.3 DATA EEPROM

In the PIC24FV16KM204 family, the data EEPROM is mapped to the top of the user program memory space, starting at address, 7FFE00, and expanding up to address, 7FFFFF.

The data EEPROM is organized as 16-bit-wide memory and 256 words deep. This memory is accessed using Table Read and Write operations similar to the user code memory.

### 4.1.4 DEVICE CONFIGURATION WORDS

Table 4-1 provides the addresses of the device Configuration Words for the PIC24FV16KM204 family. Their location in the memory map is displayed in Figure 4-1.

Refer to **Section 25.1 "Configuration Bits"** for more information on device Configuration Words.

**TABLE 4-1: DEVICE CONFIGURATION WORDS FOR PIC24FXXXXX FAMILY DEVICES**

| Configuration Word | Configuration Word Addresses |
|---|---|
| FBS | F80000 |
| FGS | F80004 |
| FOSCSEL | F80006 |
| FOSC | F80008 |
| FWDT | F8000A |
| FPOR | F8000C |
| FICD | F8000E |

**FIGURE 4-2: PROGRAM MEMORY ORGANIZATION**
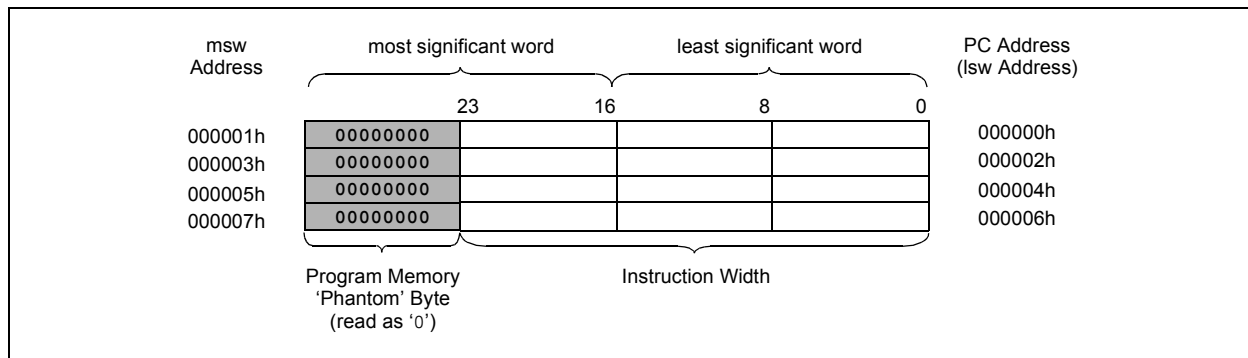

## 4.2    Data Address Space

The PIC24F core has a separate, 16-bit-wide data memory space, addressable as a single linear range. The Data Space is accessed using two Address Generation Units (AGUs), one each for read and write operations. The Data Space memory map is displayed in Figure 4-3.

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the Data Space. This gives a Data Space address range of 64 Kbytes or 32K words. The lower half of the data memory space (that is, when EA<15> = 0) is used for implemented memory addresses, while the upper half (EA<15> = 1) is reserved for the Program Space Visibility (PSV) area (see **Section 4.3.3 "Reading Data From Program Memory Using Program Space Visibility"**).

Depending on the particular device, PIC24FV16KM family devices implement either 512 or 1024 words of data memory. Should an EA point to a location outside of this area, an all zero word or byte will be returned.

### 4.2.1    DATA SPACE WIDTH

The data memory space is organized in byte-addressable, 16-bit-wide blocks. Data is aligned in data memory and registers as 16-bit words, but all the Data Space EAs resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

**FIGURE 4-3:        DATA SPACE MEMORY MAP FOR PIC24FXXXXX FAMILY DEVICES[3]**

**Note    1:**    Upper data memory boundary for PIC24FXXKM10X devices.
**2:**    Upper data memory boundary for PIC24FXXKM20X devices.
**3:**    Data memory areas are not shown to scale.
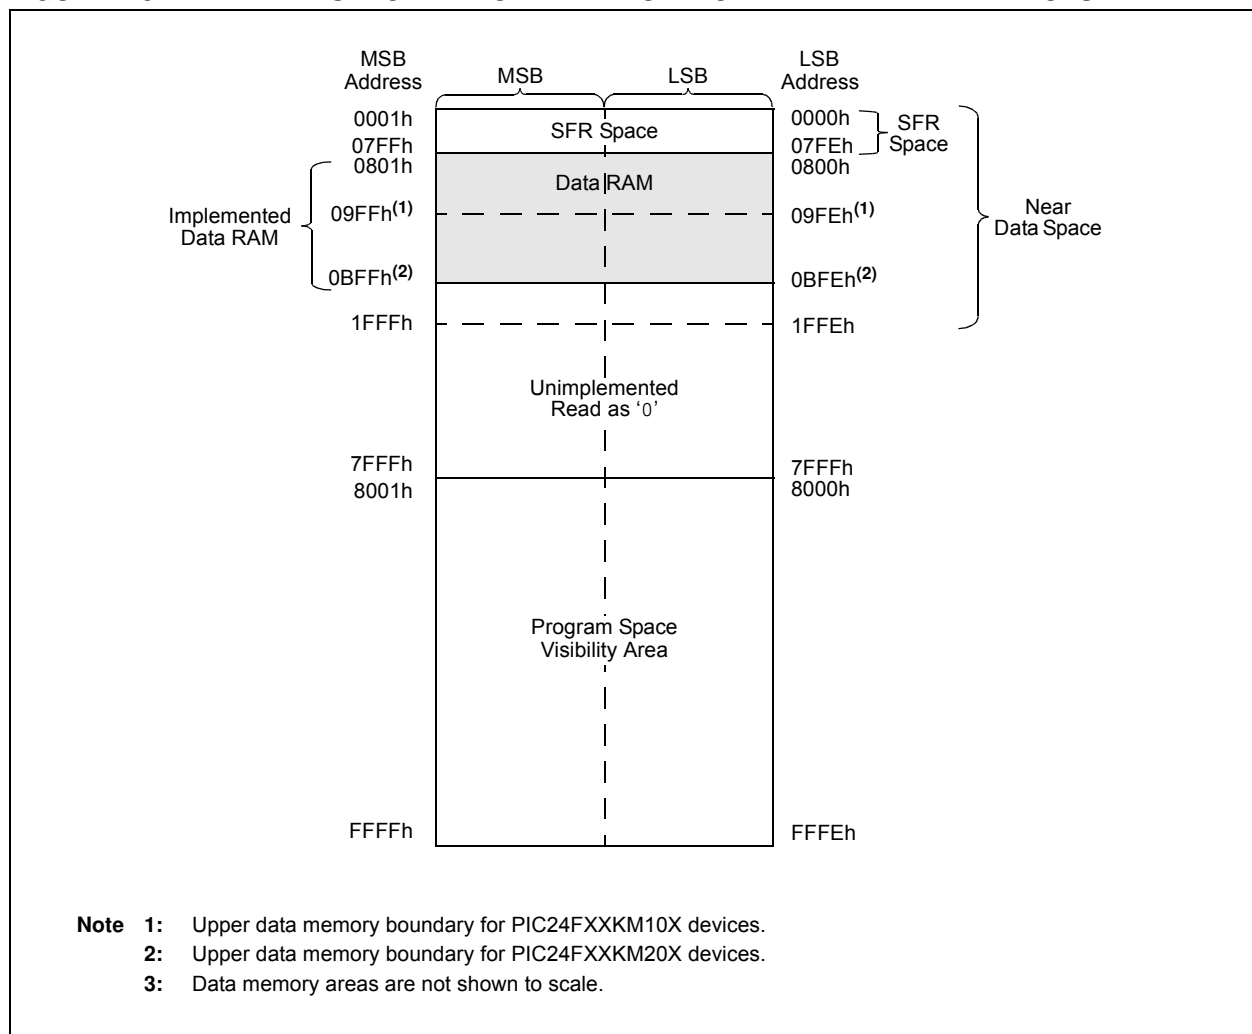

## 4.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC® devices and improve Data Space memory usage efficiency, the PIC24F instruction set supports both word and byte operations. As a consequence of byte accessibility, all EA calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] will result in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

Data byte reads will read the complete word, which contains the byte, using the LSB of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, the data memory and the registers are organized as two parallel, byte-wide entities with shared (word) address decode, but separate write lines. Data byte writes only write to the corresponding side of the array or register, which matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap will be generated. If the error occurred on a read, the instruction underway is completed; if it occurred on a write, the instruction will be executed, but the write will not occur. In either case, a trap is then executed, allowing the system and/or user to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the LSB; the MSB is not modified.

A Sign-Extend (SE) instruction is provided to allow the users to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, users can clear the MSB of any W register by executing a Zero-Extend (ZE) instruction on the appropriate address.

Although most instructions are capable of operating on word or byte data sizes, it should be noted that some instructions operate only on words.

## 4.2.3 NEAR DATA SPACE

The 8-Kbyte area between 0000h and 1FFFh is referred to as the Near Data Space. Locations in this space are directly addressable via a 13-bit absolute address field within all memory direct instructions. The remainder of the Data Space is addressable indirectly. Additionally, the whole Data Space is addressable using MOV instructions, which support Memory Direct Addressing (MDA) with a 16-bit address field. For PIC24FV16KM204 family devices, the entire implemented data memory lies in Near Data Space (NDS).

## 4.2.4 SFR SPACE

The first 2 Kbytes of the Near Data Space, from 0000h to 07FFh, are primarily occupied with Special Function Registers (SFRs). These are used by the PIC24F core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control and are generally grouped together by that module. Much of the SFR space contains unused addresses; these are read as '0'. The SFR space, where the SFRs are actually implemented, is provided in Table 4-2. Each implemented area indicates a 32-byte region where at least one address is implemented as an SFR. A complete listing of implemented SFRs, including their addresses, is provided in Table 4-3 through Table 4-26.

**TABLE 4-2: IMPLEMENTED REGIONS OF SFR DATA SPACE**

| | SFR Space Address | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | **xx00** | **xx20** | **xx40** | **xx60** | **xx80** | **xxA0** | **xxC0** | **xxE0** |

**Legend:** x = unknown, u = unchanged, — = unimplemented, q = value depends on condition, r = reserved.
**Note 1:** These bits are available only on PIC24F(V)16KM2XX devices.

### 4.2.5 SOFTWARE STACK

In addition to its use as a working register, the W15 register in PIC24F devices is also used as a Software Stack Pointer. The pointer always points to the first available free word and grows from lower to higher addresses. It pre-decrements for stack pops and post-increments for stack pushes, as depicted in Figure 4-4.

For a PC push during any CALL instruction, the MSB of the PC is zero-extended before the push, ensuring that the MSB is always clear.

> **Note:** A PC push during exception processing will concatenate the SRL register to the MSB of the PC prior to the push.

The Stack Pointer Limit Value (SPLIM) register, associated with the Stack Pointer, sets an upper address boundary for the stack. SPLIM is uninitialized at Reset. As is the case for the Stack Pointer, SPLIM<0> is forced to '0' as all stack operations must be word-aligned. Whenever an EA is generated using W15 as a source or destination pointer, the resulting address is compared with the value in SPLIM. If the contents of the Stack Pointer (W15) and the SPLIM register are equal, and a push operation is performed, a stack error trap will not occur. The stack error trap will occur on a subsequent push operation.

Thus, for example, if it is desirable to cause a stack error trap when the stack grows beyond address, 0DF6 in RAM, initialize the SPLIM with the value, 0DF4.

Similarly, a Stack Pointer underflow (stack error) trap is generated when the Stack Pointer address is found to be less than 0800h. This prevents the stack from interfering with the Special Function Register (SFR) space.

> **Note:** A write to the SPLIM register should not be immediately followed by an indirect read operation using W15.

### FIGURE 4-4: CALL STACK FRAME

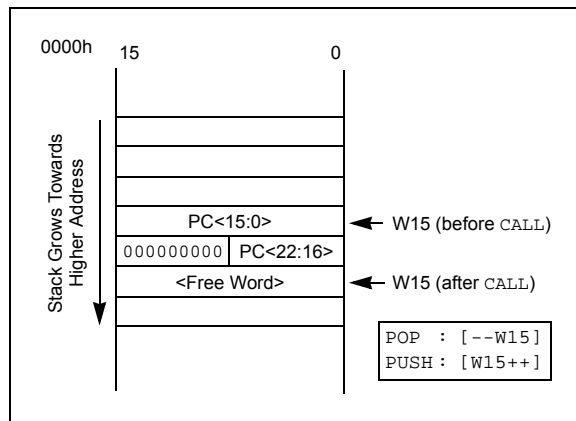

### 4.3 Interfacing Program and Data Memory Spaces

The PIC24F architecture uses a 24-bit-wide program space and 16-bit-wide Data Space (DS). The architecture is also a modified Harvard scheme, meaning that data can also be present in the program space. To use this data successfully, it must be accessed in a way that preserves the alignment of information in both spaces.

Apart from the normal execution, the PIC24F architecture provides two methods by which the program space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the program space
- Remapping a portion of the program space into the Data Space, PSV

Table instructions allow an application to read or write small areas of the program memory. This makes the method ideal for accessing data tables that need to be updated from time to time. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look ups from a large table of static data. It can only access the least significant word (lsw) of the program word.

### 4.3.1 ADDRESSING PROGRAM SPACE

Since the address ranges for the data and program spaces are 16 and 24 bits, respectively, a method is needed to create a 23-bit or 24-bit program address from 16-bit data registers. The solution depends on the interface method to be used.

For table operations, the 8-bit Table Memory Page Address register (TBLPAG) is used to define a 32K word region within the program space. This is concatenated with a 16-bit EA to arrive at a full 24-bit program space address. In this format, the Most Significant bit (MSb) of TBLPAG is used to determine if the operation occurs in the user memory (TBLPAG<7> = 0) or the configuration memory (TBLPAG<7> = 1).

For remapping operations, the 8-bit Program Space Visibility Page Address register (PSVPAG) is used to define a 16K word page in the program space. When the MSb of the EA is '1', PSVPAG is concatenated with the lower 15 bits of the EA to form a 23-bit program space address. Unlike the table operations, this limits remapping operations strictly to the user memory area.

See Table 4-35 and Figure 4-5 to know how the program EA is created for table operations and remapping accesses from the data EA. Here, P<23:0> refers to a program space word, whereas D<15:0> refers to a Data Space word.

**TABLE 4-35: PROGRAM SPACE ADDRESS CONSTRUCTION**

| Access Type | Access Space | Program Space Address | | | | |
|---|---|---|---|---|---|---|
| | | <23> | <22:16> | <15> | <14:1> | <0> |
| Instruction Access (Code Execution) | User | 0 | PC<22:1> | | | 0 |
| | | 0xx xxxx xxxx xxxx xxxx xxx0 | | | | |
| TBLRD/TBLWT (Byte/Word Read/Write) | User | TBLPAG<7:0> | | Data EA<15:0> | | |
| | | 0xxx xxxx | | xxxx xxxx xxxx xxxx | | |
| | Configuration | TBLPAG<7:0> | | Data EA<15:0> | | |
| | | 1xxx xxxx | | xxxx xxxx xxxx xxxx | | |
| Program Space Visibility (Block Remap/Read) | User | 0 | PSVPAG<7:0>[2] | | Data EA<14:0>[1] | |
| | | 0 | xxxx xxxx | | xxx xxxx xxxx xxxx | |

**Note 1:** Data EA<15> is always '1' in this case, but is not used in calculating the program space address. Bit 15 of the address is PSVPAG<0>.

**2:** PSVPAG can have only two values ('00' to access program memory and FF to access data EEPROM) on the PIC24F16KM family.

**FIGURE 4-5: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION**

**Note 1:** The LSb of program space addresses is always fixed as '0' in order to maintain word alignment of data in the program and Data Spaces.

**2:** Table operations are not required to be word-aligned. Table Read operations are permitted in the configuration memory space.
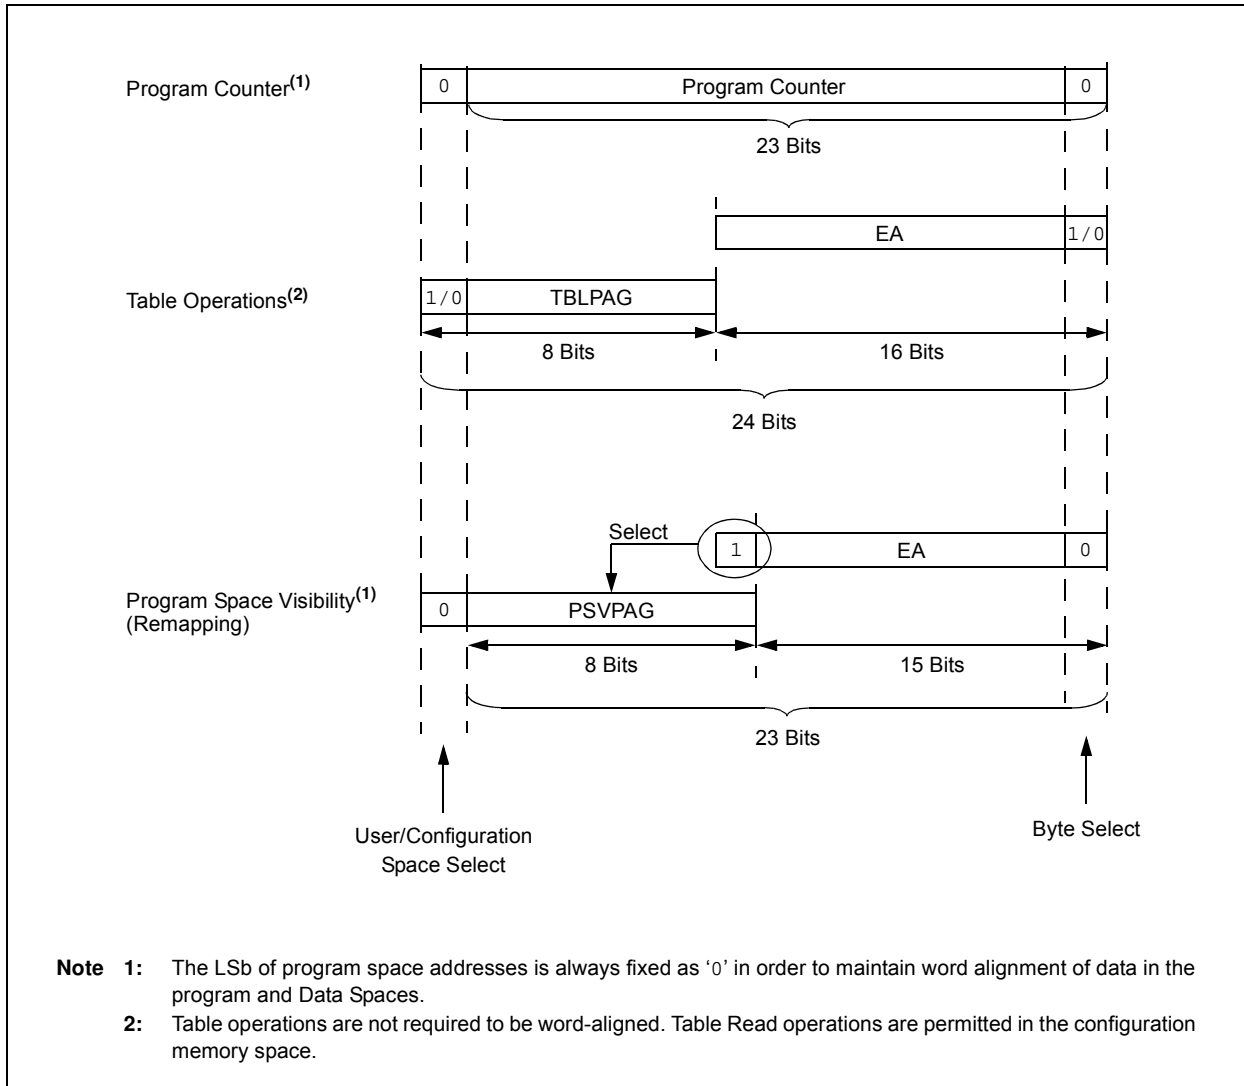

### 4.3.2 DATA ACCESS FROM PROGRAM MEMORY AND DATA EEPROM MEMORY USING TABLE INSTRUCTIONS

The TBLRDL and TBLWTL instructions offer a direct method of reading or writing the lower word of any address within the program memory without going through Data Space. It also offers a direct method of reading or writing a word of any address within data EEPROM memory. The TBLRDH and TBLWTH instructions are the only method to read or write the upper 8 bits of a program space word as data.

> **Note:** The TBLRDH and TBLWTH instructions are not used while accessing data EEPROM memory.

The PC is incremented by 2 for each successive 24-bit program word. This allows program memory addresses to directly map to Data Space addresses. Program memory can thus be regarded as two 16-bit, word-wide address spaces, residing side by side, each with the same address range. TBLRDL and TBLWTL access the space which contains the least significant data word, and TBLRDH and TBLWTH access the space which contains the upper data byte.

Two table instructions are provided to move byte or word-sized (16-bit) data to and from program space. Both function as either byte or word operations.

1. TBLRDL (Table Read Low): In Word mode, it maps the lower word of the program space location (P<15:0>) to a data address (D<15:0>).

In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when byte select is '1'; the lower byte is selected when it is '0'.

2. TBLRDH (Table Read High): In Word mode, it maps the entire upper word of a program address (P<23:16>) to a data address. Note that D<15:8>, the 'phantom' byte, will always be '0'.

In Byte mode, it maps the upper or lower byte of the program word to D<7:0> of the data address, as above. Note that the data will always be '0' when the upper 'phantom' byte is selected (Byte Select = 1).

In a similar fashion, two table instructions, TBLWTH and TBLWTL, are used to write individual bytes or words to a program space address. The details of their operation are explained in **Section 5.0 "Flash Program Memory"**.

For all table operations, the area of program memory space to be accessed is determined by the Table Memory Page Address register (TBLPAG). TBLPAG covers the entire program memory space of the device, including user and configuration spaces. When TBLPAG<7> = 0, the table page is located in the user memory space. When TBLPAG<7> = 1, the page is located in configuration space.

> **Note:** Only Table Read operations will execute in the configuration memory space, and only then, in implemented areas, such as the Device ID. Table Write operations are not allowed.

### FIGURE 4-6: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS
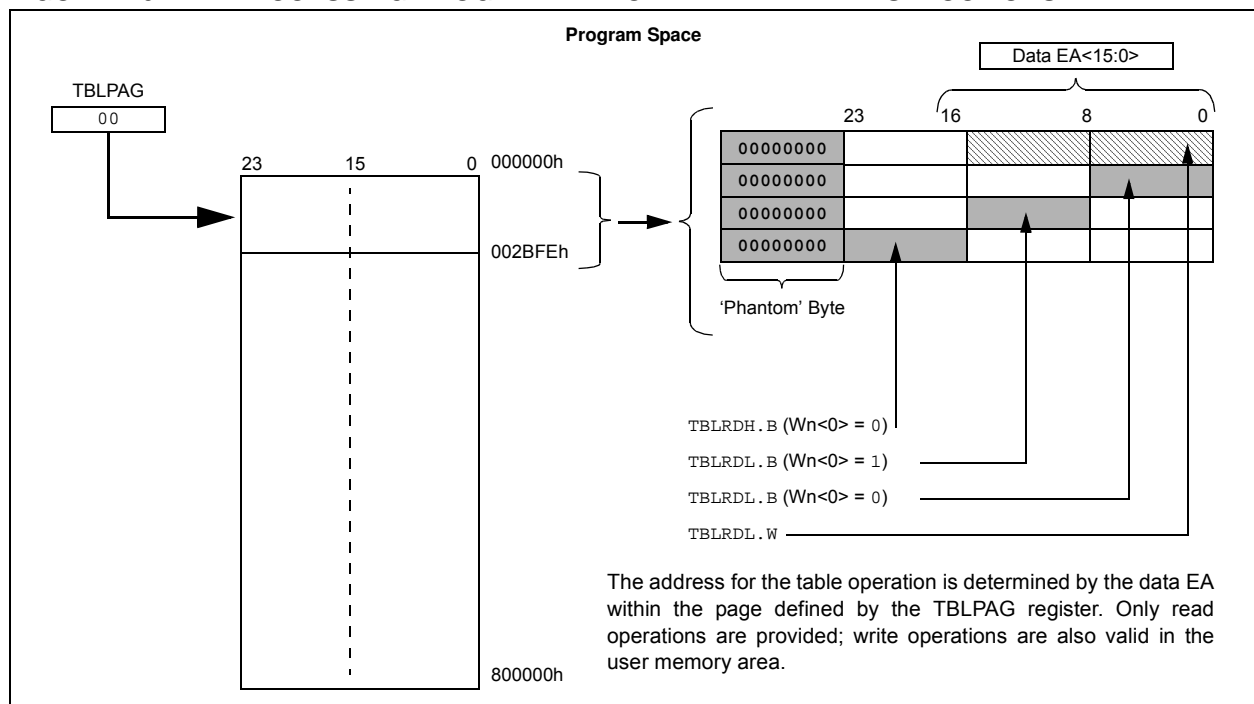

### 4.3.3 READING DATA FROM PROGRAM MEMORY USING PROGRAM SPACE VISIBILITY

The upper 32 Kbytes of Data Space may optionally be mapped into a 16K word page of the program space. This provides transparent access of stored constant data from the Data Space without the need to use special instructions (i.e., TBLRDL/H).

Program space access through the Data Space occurs if the MSb of the Data Space, EA, is '1' and PSV is enabled by setting the PSV bit in the CPU Control (CORCON<2>) register. The location of the program memory space to be mapped into the Data Space is determined by the Program Space Visibility Page Address register (PSVPAG). This 8-bit register defines any one of 256 possible pages of 16K words in program space. In effect, PSVPAG functions as the upper 8 bits of the program memory address, with the 15 bits of the EA functioning as the lower bits.

By incrementing the PC by 2 for each program memory word, the lower 15 bits of Data Space addresses directly map to the lower 15 bits in the corresponding program space addresses.

Data reads from this area add an additional cycle to the instruction being executed, since two program memory fetches are required.

Although each Data Space address, 8000h and higher, maps directly into a corresponding program memory address (see Figure 4-7), only the lower 16 bits of the 24-bit program word are used to contain the data. The upper 8 bits of any program space locations used as data should be programmed with '1111 1111' or '0000 0000' to force a NOP. This prevents possible issues should the area of code ever be accidentally executed.

> **Note:** PSV access is temporarily disabled during Table Reads/Writes.

For operations that use PSV and are executed outside a REPEAT loop, the MOV and MOV.D instructions will require one instruction cycle in addition to the specified execution time. All other instructions will require two instruction cycles in addition to the specified execution time.

For operations that use PSV, which are executed inside a REPEAT loop, there will be some instances that require two instruction cycles in addition to the specified execution time of the instruction:

- Execution in the first iteration
- Execution in the last iteration
- Execution prior to exiting the loop due to an interrupt
- Execution upon re-entering the loop after an interrupt is serviced

Any other iteration of the REPEAT loop will allow the instruction accessing data, using PSV, to execute in a single cycle.

**FIGURE 4-7: PROGRAM SPACE VISIBILITY OPERATION**
## 5.0    FLASH PROGRAM MEMORY

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Flash programming, refer to the *"PIC24F Family Reference Manual"*, **"Program Memory"** (DS39715).

The PIC24FV16KM204 family of devices contains internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable when operating with V$_{DD}$ over 1.8V.

Flash memory can be programmed in three ways:

- In-Circuit Serial Programming™ (ICSP™)
- Run-Time Self-Programming (RTSP)
- Enhanced In-Circuit Serial Programming (Enhanced ICSP)

ICSP allows a PIC24FXXXXX device to be serially programmed while in the end application circuit. This is simply done with two lines for the programming clock and programming data (which are named PGECx and PGEDx, respectively), and three other lines for power (V$_{DD}$), ground (V$_{SS}$) and Master Clear/Program Mode Entry Voltage (MCLR/V$_{PP}$). This allows customers to manufacture boards with unprogrammed devices and then program the microcontroller just before shipping the product. This also allows the most recent firmware or custom firmware to be programmed.

Run-Time Self-Programming (RTSP) is accomplished using `TBLRD` (Table Read) and `TBLWT` (Table Write) instructions. With RTSP, the user may write program memory data in blocks of 32 instructions (96 bytes) at a time, and erase program memory in blocks of 32, 64 and 128 instructions (96,192 and 384 bytes) at a time.

The NVMOP<1:0> (NVMCON<1:0>) bits decide the erase block size.

### 5.1    Table Instructions and Flash Programming

Regardless of the method used, Flash memory programming is done with the Table Read and Write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using the TBLPAG<7:0> bits and the Effective Address (EA) from a W register, specified in the table instruction, as depicted in Figure 5-1.

The `TBLRDL` and the `TBLWTL` instructions are used to read or write to bits<15:0> of program memory. `TBLRDL` and `TBLWTL` can access program memory in both Word and Byte modes.

The `TBLRDH` and `TBLWTH` instructions are used to read or write to bits<23:16> of program memory. `TBLRDH` and `TBLWTH` can also access program memory in Word or Byte mode.

**FIGURE 5-1:**      **ADDRESSING FOR TABLE REGISTERS**

---
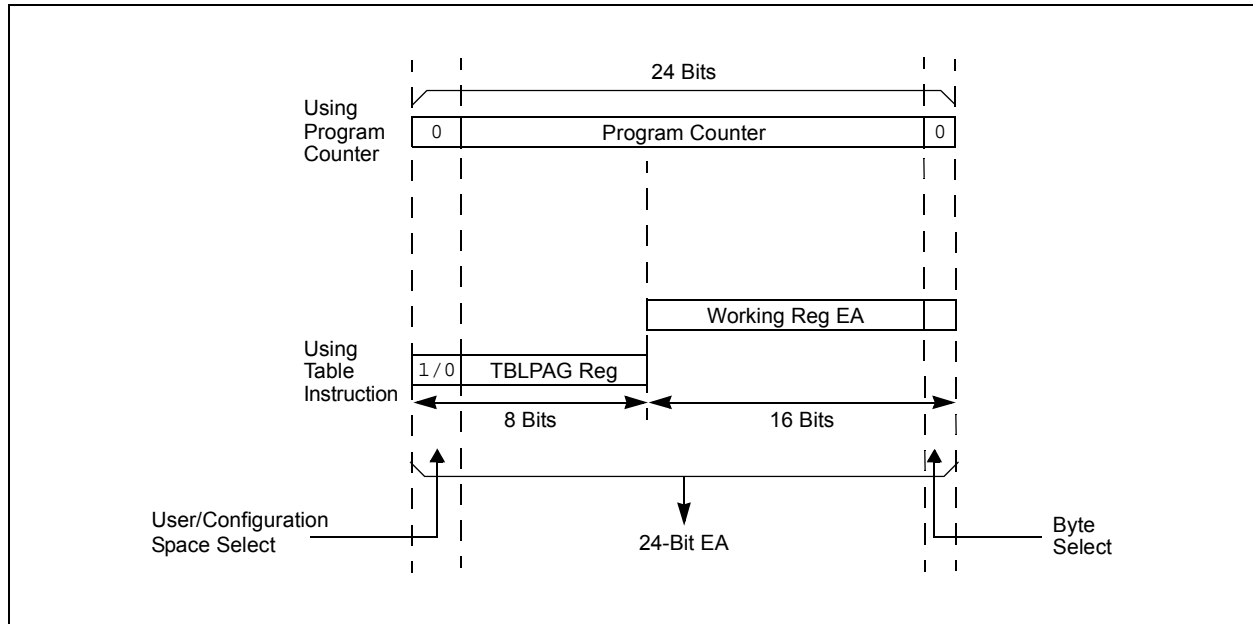

## 5.2 RTSP Operation

The PIC24F Flash program memory array is organized into rows of 32 instructions or 96 bytes. RTSP allows the user to erase blocks of 1 row, 2 rows and 4 rows (32, 64 and 128 instructions) at a time, and to program one row at a time. It is also possible to program single words.

The 1-row (96 bytes), 2-row (192 bytes) and 4-row (384 bytes) erase blocks, and single row write block (96 bytes) are edge-aligned, from the beginning of program memory.

When data is written to program memory using `TBLWT` instructions, the data is not written directly to memory. Instead, data written using Table Writes is stored in holding latches until the programming sequence is executed.

Any number of `TBLWT` instructions can be executed and a write will be successfully performed. However, 32 `TBLWT` instructions are required to write the full row of memory.

The basic sequence for RTSP programming is to set up a Table Pointer, then do a series of `TBLWT` instructions to load the buffers. Programming is performed by setting the control bits in the NVMCON register.

Data can be loaded in any order and the holding registers can be written to multiple times before performing a write operation. Subsequent writes, however, will wipe out any previous writes.

> **Note:** Writing to a location multiple times, without erasing it, is not recommended.

All of the Table Write operations are single-word writes (two instruction cycles), because only the buffers are written. A programming cycle is required for programming each row.

## 5.3 Enhanced In-Circuit Serial Programming

Enhanced ICSP uses an on-board bootloader, known as the Program Executive (PE), to manage the programming process. Using an SPI data frame format, the Program Executive can erase, program and verify program memory. For more information on Enhanced ICSP, see the device programming specification.

## 5.4 Control Registers

There are two SFRs used to read and write the program Flash memory: NVMCON and NVMKEY.

The NVMCON register (Register 5-1) controls the blocks that need to be erased, which memory type is to be programmed and when the programming cycle starts.

NVMKEY is a write-only register that is used for write protection. To start a programming or erase sequence, the user must consecutively write 55h and AAh to the NVMKEY register. Refer to **Section 5.5 "Programming Operations"** for further details.

## 5.5 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. During a programming or erase operation, the processor stalls (waits) until the operation is finished. Setting the WR bit (NVMCON<15>) starts the operation and the WR bit is automatically cleared when the operation is finished.

**REGISTER 5-1:** **NVMCON: FLASH MEMORY CONTROL REGISTER**

| R/SO-0, HC | R/W-0 | R/W-0 | R/W-0 | U-0 | U-0 | U-0 | U-0 |
|---|---|---|---|---|---|---|---|
| WR | WREN | WRERR | PGMONLY[4] | — | — | — | — |
| bit 15 | | | | | | | bit 8 |

| U-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
|---|---|---|---|---|---|---|---|
| — | ERASE | NVMOP5[1] | NVMOP4[1] | NVMOP3[1] | NVMOP2[1] | NVMOP1[1] | NVMOP0[1] |
| bit 7 | | | | | | | bit 0 |

| Legend: | SO = Settable Only bit | HC = Hardware Clearable bit | |
|---|---|---|---|
| -n = Value at POR | '1' = Bit is set | R = Readable bit | W = Writable bit |
| '0' = Bit is cleared | x = Bit is unknown | U = Unimplemented bit, read as '0' | |

bit 15      **WR:** Write Control bit

         1 = Initiates a Flash memory program or erase operation; the operation is self-timed and the bit is cleared by hardware once the operation is complete
         0 = Program or erase operation is complete and inactive

bit 14      **WREN:** Write Enable bit

         1 = Enables Flash program/erase operations
         0 = Inhibits Flash program/erase operations

bit 13      **WRERR:** Write Sequence Error Flag bit

         1 = An improper program or erase sequence attempt, or termination has occurred (bit is set automatically on any set attempt of the WR bit)
         0 = The program or erase operation completed normally

bit 12      **PGMONLY:** Program Only Enable bit[4]

bit 11-7      **Unimplemented:** Read as '0'

bit 6       **ERASE:** Erase/Program Enable bit

         1 = Performs the erase operation specified by the NVMOP<5:0> bits on the next WR command
         0 = Performs the program operation specified by the NVMOP<5:0> bits on the next WR command

bit 5-0      **NVMOP<5:0>:** Programming Operation Command Byte bits[1]

         Erase Operations (when ERASE bit is '1'):
         1010xx = Erase entire boot block (including code-protected boot block)[2]
         1001xx = Erase entire memory (including boot block, configuration block, general block)[2]
         011010 = Erase 4 rows of Flash memory[3]
         011001 = Erase 2 rows of Flash memory[3]
         011000 = Erase 1 row of Flash memory[3]
         0101xx = Erase entire configuration block (except code protection bits)
         0100xx = Erase entire data EEPROM[4]
         0011xx = Erase entire general memory block programming operations
         0001xx = Write 1 row of Flash memory (when ERASE bit is '0')[3]

**Note 1:** All other combinations of NVMOP<5:0> are no operation.
     **2:** Available in ICSP™ mode only. Refer to the device programming specification.
     **3:** The address in the Table Pointer decides which rows will be erased.
     **4:** This bit is used only while accessing data EEPROM.

### 5.5.1 PROGRAMMING ALGORITHM FOR FLASH PROGRAM MEMORY

The user can program one row of Flash program memory at a time by erasing the programmable row. The general process is:

1. Read a row of program memory (32 instructions) and store in data RAM.
2. Update the program data in RAM with the desired new data.
3. Erase a row (see Example 5-1):
   a) Set the NVMOPx bits (NVMCON<5:0>) to '011000' to configure for row erase. Set the ERASE (NVMCON<6>) and WREN (NVMCON<14>) bits.
   b) Write the starting address of the block to be erased into the TBLPAG and W registers.
   c) Write 55h to NVMKEY.
   d) Write AAh to NVMKEY.
   e) Set the WR bit (NVMCON<15>). The erase cycle begins and the CPU stalls for the duration of the erase cycle. When the erase is done, the WR bit is cleared automatically.

4. Write the first 32 instructions from data RAM into the program memory buffers (see Example 5-1).
5. Write the program block to Flash memory:
   a) Set the NVMOPx bits to '000100' to configure for row programming. Clear the ERASE bit and set the WREN bit.
   b) Write 55h to NVMKEY.
   c) Write AAh to NVMKEY.
   d) Set the WR bit. The programming cycle begins and the CPU stalls for the duration of the write cycle. When the write to Flash memory is done, the WR bit is cleared automatically.

For protection against accidental operations, the write initiate sequence for NVMKEY must be used to allow any erase or program operation to proceed. After the programming command has been executed, the user must wait for the programming time until programming is complete. The two instructions following the start of the programming sequence should be NOPs, as displayed in Example 5-5.

**EXAMPLE 5-1: ERASING A PROGRAM MEMORY ROW – ASSEMBLY LANGUAGE CODE**

```
; Set up NVMCON for row erase operation
        MOV     #0x4058, W0                 ;
        MOV     W0, NVMCON                  ; Initialize NVMCON
; Init pointer to row to be ERASED
        MOV     #tblpage(PROG_ADDR), W0     ;
        MOV     W0, TBLPAG                  ; Initialize PM Page Boundary SFR
        MOV     #tbloffset(PROG_ADDR), W0   ; Initialize in-page EA[15:0] pointer
        TBLWTL  W0, [W0]                    ; Set base address of erase block
        DISI    #5                          ; Block all interrupts
                                            ;   for next 5 instructions
        MOV     #0x55, W0
        MOV     W0, NVMKEY                  ; Write the 55 key
        MOV     #0xAA, W1                   ;
        MOV     W1, NVMKEY                  ; Write the AA key
        BSET    NVMCON, #WR                 ; Start the erase sequence
        NOP                                 ; Insert two NOPs after the erase
        NOP                                 ; command is asserted
```

**EXAMPLE 5-2: ERASING A PROGRAM MEMORY ROW – 'C' LANGUAGE CODE**

```
// C example using MPLAB C30

int __attribute__ ((space(auto_psv))) progAddr = 0x1234;   // Variable located in Pgm Memory, declared as a
                                                           // global variable
    unsigned int offset;

//Set up pointer to the first memory location to be written

    TBLPAG = __builtin_tblpage(&progAddr);          // Initialize PM Page Boundary SFR
    offset = __builtin_tbloffset(&progAddr);        // Initialize lower word of address

    __builtin_tblwtl(offset, 0x0000);               // Set base address of erase block
                                                    // with dummy latch write

    NVMCON = 0x4058;                                // Initialize NVMCON

    asm("DISI #5");                                 // Block all interrupts for next 5 instructions
    __builtin_write_NVM();                          // C30 function to perform unlock
                                                    // sequence and set WR
```

**EXAMPLE 5-3:    LOADING THE WRITE BUFFERS – ASSEMBLY LANGUAGE CODE**

```
; Set up NVMCON for row programming operations
        MOV     #0x4004, W0                  ;
        MOV     W0, NVMCON                   ; Initialize NVMCON
; Set up a pointer to the first program memory location to be written
; program memory selected, and writes enabled
        MOV     #0x0000, W0                  ;
        MOV     W0, TBLPAG                   ; Initialize PM Page Boundary SFR
        MOV     #0x1500, W0                  ; An example program memory address
; Perform the TBLWT instructions to write the latches
; 0th_program_word
        MOV     #LOW_WORD_0, W2              ;
        MOV     #HIGH_BYTE_0, W3             ;
        TBLWTL  W2, [W0]                     ; Write PM low word into program latch
        TBLWTH  W3, [W0++]                   ; Write PM high byte into program latch
; 1st_program_word
        MOV     #LOW_WORD_1, W2              ;
        MOV     #HIGH_BYTE_1, W3             ;
        TBLWTL  W2, [W0]                     ; Write PM low word into program latch
        TBLWTH  W3, [W0++]                   ; Write PM high byte into program latch
; 2nd_program_word
        MOV     #LOW_WORD_2, W2              ;
        MOV     #HIGH_BYTE_2, W3             ;
        TBLWTL  W2, [W0]                     ; Write PM low word into program latch
        TBLWTH  W3, [W0++]                   ; Write PM high byte into program latch
        •
        •
        •
; 32nd_program_word
        MOV     #LOW_WORD_31, W2             ;
        MOV     #HIGH_BYTE_31, W3            ;
        TBLWTL  W2, [W0]                     ; Write PM low word into program latch
        TBLWTH  W3, [W0]                     ; Write PM high byte into program latch
```

**EXAMPLE 5-4:    LOADING THE WRITE BUFFERS – 'C' LANGUAGE CODE**

```
// C example using MPLAB C30

   #define NUM_INSTRUCTION_PER_ROW 64
int __attribute__ ((space(auto_psv))) progAddr = 0x1234      // Variable located in Pgm Memory
   unsigned int offset;
   unsigned int i;
   unsigned int progData[2*NUM_INSTRUCTION_PER_ROW];         // Buffer of data to write

   //Set up NVMCON for row programming
   NVMCON = 0x4004;                                          // Initialize NVMCON

   //Set up pointer to the first memory location to be written
   TBLPAG = __builtin_tblpage(&progAddr);                    // Initialize PM Page Boundary SFR
   offset = __builtin_tbloffset(&progAddr);                  // Initialize lower word of address

   //Perform TBLWT instructions to write necessary number of latches
   for(i=0; i < 2*NUM_INSTRUCTION_PER_ROW; i++)
   {
       __builtin_tblwtl(offset, progData[i++]);             // Write to address low word
       __builtin_tblwth(offset, progData[i]);               // Write to upper byte
       offset = offset + 2;                                 // Increment address
   }
```

**EXAMPLE 5-5: INITIATING A PROGRAMMING SEQUENCE – ASSEMBLY LANGUAGE CODE**

```
        DISI    #5                      ; Block all interrupts
                                          for next 5 instructions
        MOV     #0x55, W0
        MOV     W0, NVMKEY              ; Write the 55 key
        MOV     #0xAA, W1              ;
        MOV     W1, NVMKEY             ; Write the AA key
        BSET    NVMCON, #WR            ; Start the erase sequence
        NOP                            ; 2 NOPs required after setting WR
        NOP                            ;
        BTSC    NVMCON, #15            ; Wait for the sequence to be completed
        BRA     $-2                    ;
```

**EXAMPLE 5-6: INITIATING A PROGRAMMING SEQUENCE – 'C' LANGUAGE CODE**

```
// C example using MPLAB C30

asm("DISI #5");                 // Block all interrupts for next 5 instructions

__builtin_write_NVM();          // Perform unlock sequence and set WR
```

## 6.0 DATA EEPROM MEMORY

**Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on data EEPROM, refer to the *"PIC24F Family Reference Manual"*, **"Data EEPROM"** (DS39720).

The data EEPROM memory is a Nonvolatile Memory (NVM), separate from the program and volatile data RAM. Data EEPROM memory is based on the same Flash technology as program memory, and is optimized for both long retention and a higher number of erase/write cycles.

The data EEPROM is mapped to the top of the user program memory space, with the top address at program memory address, 7FFE00h to 7FFFFFh. The size of the data EEPROM is 256 words in PIC24FXXXXX devices.

The data EEPROM is organized as 16-bit-wide memory. Each word is directly addressable, and is readable and writable during normal operation over the entire V$_{DD}$ range.

Unlike the Flash program memory, normal program execution is not stopped during a data EEPROM program or erase operation.

The data EEPROM programming operations are controlled using the three NVM Control registers:

• NVMCON: Nonvolatile Memory Control Register
• NVMKEY: Nonvolatile Memory Key Register
• NVMADR: Nonvolatile Memory Address Register

### 6.1 NVMCON Register

The NVMCON register (Register 6-1) is also the primary control register for data EEPROM program/erase operations. The upper byte contains the control bits used to start the program or erase cycle and the flag bit to indicate if the operation was successfully performed. The lower byte of NVMCOM configures the type of NVM operation that will be performed.

### 6.2 NVMKEY Register

The NVMKEY is a write-only register that is used to prevent accidental writes or erasures of data EEPROM locations.

To start any programming or erase sequence, the following instructions must be executed first, in the exact order provided:

1. Write 55h to NVMKEY.
2. Write AAh to NVMKEY.

After this sequence, a write will be allowed to the NVMCON register for one instruction cycle. In most cases, the user will simply need to set the WR bit in the NVMCON register to start the program or erase cycle. Interrupts should be disabled during the unlock sequence.

The MPLAB® C30 C compiler provides a defined library procedure (builtin_write_NVM) to perform the unlock sequence. Example 6-1 illustrates how the unlock sequence can be performed with in-line assembly.

### EXAMPLE 6-1: DATA EEPROM UNLOCK SEQUENCE

```
//Disable Interrupts For 5 instructions
asm volatile  ("disi #5");
//Issue Unlock Sequence
asm volatile  ("mov #0x55, W0    \n"
               "mov W0, NVMKEY    \n"
               "mov #0xAA, W1     \n"
               "mov W1, NVMKEY    \n");
// Perform Write/Erase operations
asm volatile  ("bset NVMCON, #WR  \n"
               "nop               \n"
               "nop               \n");
```

# PIC24FV16KM204 FAMILY

| — | ERASE | NVMOP5 | NVMOP4 | NVMOP3 | NVMOP2 | NVMOP1 | NVMOP0 |
| bit 7 | | | | | | | bit 0 |

| Legend: | | |
|---|---|---|
| | HC = Hardware Clearable bit | U = Unimplemented bit, read as '0' |
| R = Readable bit | W = Writable bit | S = Settable Only bit |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared     x = Bit is unknown |

bit 15        **WR:** Write Control bit (program or erase)

1 =  Initiates a data EEPROM erase or write cycle (can be set, but not cleared in software)
0 =  Write cycle is complete (cleared automatically by hardware)

bit 14        **WREN:** Write Enable bit (erase or program)

1 = Enables an erase or program operation
0 = No operation allowed (device clears this bit on completion of the write/erase operation)

bit 13        **WRERR:** Flash Error Flag bit

1 = A write operation is prematurely terminated (any $\overline{MCLR}$ or WDT Reset during programming operation)
0 = The write operation completed successfully

bit 12        **PGMONLY:** Program Only Enable bit

1 = Write operation is executed without erasing target address(es) first
0 = Automatic erase-before-write
Write operations are preceded automatically by an erase of the target address(es).

bit 11-7      **Unimplemented:** Read as '0'

bit 6         **ERASE:** Erase Operation Select bit

1 =  Performs an erase operation when WR is set
0 =  Performs a write operation when WR is set

bit 5-0       **NVMOP<5:0>:** Programming Operation Command Byte bits

Erase Operations (when ERASE bit is '1'):
011010 = Erase 8 words
011001 = Erase 4 words
011000 = Erase 1 word
0100xx = Erase entire data EEPROM
Programming Operations (when ERASE bit is '0'):
0001xx = Write 1 word

---

## 6.3 NVM Address Register

As with Flash program memory, the NVM Address registers, NVMADRU and NVMADR, form the 24-bit Effective Address (EA) of the selected row or word for data EEPROM operations. The NVMADRU register is used to hold the upper 8 bits of the EA, while the NVMADR register is used to hold the lower 16 bits of the EA. These registers are not mapped into the Special Function Register (SFR) space; instead, they directly capture the EA<23:0> of the last Table Write instruction that has been executed and select the data EEPROM row to erase. Figure 6-1 depicts the program memory EA that is formed for programming and erase operations.

Like program memory operations, the Least Significant bit (LSb) of NVMADR is restricted to even addresses. This is because any given address in the data EEPROM space consists of only the lower word of the program memory width; the upper word, including the uppermost "phantom byte", are unavailable. This means that the LSb of a data EEPROM address will always be '0'.

Similarly, the Most Significant bit (MSb) of NVMADRU is always '0', since all addresses lie in the user program space.

**FIGURE 6-1:** **DATA EEPROM ADDRESSING WITH TBLPAG AND NVM ADDRESS REGISTERS**

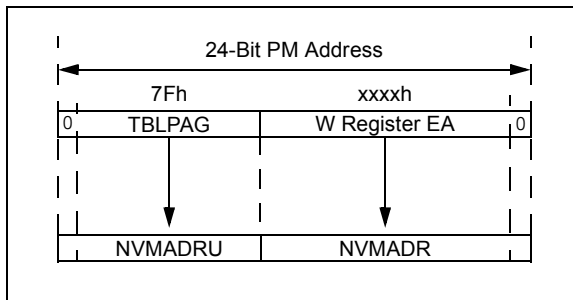

## 6.4 Data EEPROM Operations

The EEPROM block is accessed using Table Read and Write operations, similar to those used for program memory. The `TBLWTH` and `TBLRDH` instructions are not required for data EEPROM operations since the memory is only 16 bits wide (data on the lower address is valid only). The following programming operations can be performed on the data EEPROM:

* Erase one, four or eight words
* Bulk erase the entire data EEPROM
* Write one word
* Read one word

> **Note 1:** Unexpected results will be obtained if the user attempts to read the EEPROM while a programming or erase operation is underway.
>
> **2:** The XC16 C compiler includes library procedures to automatically perform the Table Read and Table Write operations, manage the Table Pointer and write buffers, and unlock and initiate memory write sequences. This eliminates the need to create assembler macros or time critical routines in C for each application.

The library procedures are used in the code examples detailed in the following sections. General descriptions of each process are provided for users who are not using the XC16 compiler libraries.

### 6.4.1 ERASE DATA EEPROM

The data EEPROM can be fully erased, or can be partially erased, at three different sizes: one word, four words or eight words. The bits, NVMOP<1:0> (NVMCON<1:0>), decide the number of words to be erased. To erase partially from the data EEPROM, the following sequence must be followed:

1. Configure NVMCON to erase the required number of words: one, four or eight.
2. Load TBLPAG and WREG with the EEPROM address to be erased.
3. Clear the NVMIF status bit and enable the NVM interrupt (optional).
4. Write the key sequence to NVMKEY.
5. Set the WR bit to begin the erase cycle.
6. Either poll the WR bit or wait for the NVM interrupt (NVMIF is set).

A typical erase sequence is provided in Example 6-2. This example shows how to do a one-word erase. Similarly, a four-word erase and an eight-word erase can be done. This example uses C library procedures to manage the Table Pointer (`builtin_tblpage` and `builtin_tbloffset`) and the Erase Page Pointer (`builtin_tblwtl`). The memory unlock sequence (`builtin_write_NVM`) also sets the WR bit to initiate the operation and returns control when complete.

**EXAMPLE 6-2: SINGLE-WORD ERASE**

```
int __attribute__ ((space(eedata))) eeData = 0x1234;
/*-------------------------------------------------------------------------------------------
The variable eeData must be a Global variable declared outside of any method

the code following this comment can be written inside the method that will execute the erase
-------------------------------------------------------------------------------------------
*/
    unsigned int offset;

    // Set up NVMCON to erase one word of data EEPROM
    NVMCON = 0x4058;

    // Set up a pointer to the EEPROM location to be erased
    TBLPAG = __builtin_tblpage(&eeData);          // Initialize EE Data page pointer
    offset = __builtin_tbloffset(&eeData);        // Initizlize lower word of address
    __builtin_tblwtl(offset, 0);                  // Write EEPROM data to write latch

    asm volatile ("disi #5");                     // Disable Interrupts For 5 Instructions
    __builtin_write_NVM();                        // Issue Unlock Sequence & Start Write Cycle
    while(NVMCONbits.WR=1);                        // Optional: Poll WR bit to wait for
                                                  // write sequence to complete
```

### 6.4.1.1 Data EEPROM Bulk Erase

To erase the entire data EEPROM (bulk erase), the address registers do not need to be configured because this operation affects the entire data EEPROM. The following sequence helps in performing a bulk erase:

1. Configure NVMCON to Bulk Erase mode.
2. Clear the NVMIF status bit and enable the NVM interrupt (optional).
3. Write the key sequence to NVMKEY.
4. Set the WR bit to begin the erase cycle.
5. Either poll the WR bit or wait for the NVM interrupt (NVMIF is set).

A typical bulk erase sequence is provided in Example 6-3.

### 6.4.2 SINGLE-WORD WRITE

To write a single word in the data EEPROM, the following sequence must be followed:

1. Erase one data EEPROM word (as mentioned in the previous section) if the PGMONLY bit (NVMCON<12>) is set to '1'.
2. Write the data word into the data EEPROM latch.
3. Program the data word into the EEPROM:
   - Configure the NVMCON register to program one EEPROM word (NVMCON<5:0> = 0001xx).
   - Clear the NVMIF status bit and enable the NVM interrupt (optional).
   - Write the key sequence to NVMKEY.
   - Set the WR bit to begin the erase cycle.
   - Either poll the WR bit or wait for the NVM interrupt (NVMIF is set).
   - To get cleared, wait until NVMIF is set.

A typical single-word write sequence is provided in Example 6-4.

### EXAMPLE 6-3: DATA EEPROM BULK ERASE

```
    // Set up NVMCON to bulk erase the data EEPROM
    NVMCON = 0x4050;

    // Disable Interrupts For 5 Instructions
    asm volatile ("disi #5");

    // Issue Unlock Sequence and Start Erase Cycle
    __builtin_write_NVM();
```

### EXAMPLE 6-4: SINGLE-WORD WRITE TO DATA EEPROM

```
int __attribute__ ((space(eedata))) eeData = 0x1234;
   int newData;                                     // New data to write to EEPROM
/*-------------------------------------------------------------------------------------------
The variable eeData must be a Global variable declared outside of any method

the code following this comment can be written inside the method that will execute the write
---------------------------------------------------------------------------------------------
*/
   unsigned int offset;

   // Set up NVMCON to erase one word of data EEPROM
   NVMCON = 0x4004;

   // Set up a pointer to the EEPROM location to be erased
   TBLPAG = __builtin_tblpage(&eeData);          // Initialize EE Data page pointer
   offset = __builtin_tbloffset(&eeData);        // Initizlize lower word of address
   __builtin_tblwtl(offset, newData);            // Write EEPROM data to write latch

   asm volatile ("disi #5");                     // Disable Interrupts For 5 Instructions
   __builtin_write_NVM();                        // Issue Unlock Sequence & Start Write Cycle
   while(NVMCONbits.WR=1);                        // Optional: Poll WR bit to wait for
                                                  // write sequence to complete
```

### 6.4.3 READING THE DATA EEPROM

To read a word from data EEPROM, the Table Read instruction is used. Since the EEPROM array is only 16 bits wide, only the TBLRDL instruction is needed. The read operation is performed by loading TBLPAG and WREG with the address of the EEPROM location, followed by a TBLRDL instruction.

A typical read sequence, using the Table Pointer management (builtin_tblpage and builtin_tbloffset) and Table Read (builtin_tblrdl) procedures from the C30 compiler library, is provided in Example 6-5.

Program Space Visibility (PSV) can also be used to read locations in the data EEPROM.

**EXAMPLE 6-5: READING THE DATA EEPROM USING THE TBLRD COMMAND**

```
int __attribute__ ((space(eedata))) eeData = 0x1234;
int data;                                           // Data read from EEPROM
/*---------------------------------------------------------------------------------------
The variable eeData must be a Global variable declared outside of any method

the code following this comment can be written inside the method that will execute the read
-----------------------------------------------------------------------------------------
*/
    unsigned int offset;

    // Set up a pointer to the EEPROM location to be erased
    TBLPAG = __builtin_tblpage(&eeData);            // Initialize EE Data page pointer
    offset = __builtin_tbloffset(&eeData);          // Initizlize lower word of address
    data = __builtin_tblrdl(offset);                // Write EEPROM data to write latch
```

## 7.0 RESETS

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Resets, refer to the *"PIC24F Family Reference Manual"*, **"Reset with Programmable Brown-out Reset"** (DS39728).

The Reset module combines all Reset sources and controls the device Master Reset Signal, $\overline{SYSRST}$. The following is a list of device Reset sources:

• POR: Power-on Reset
• $\overline{MCLR}$: Pin Reset
• SWR: RESET Instruction
• WDTR: Watchdog Timer Reset
• BOR: Brown-out Reset
• LPBOR: Low-Power BOR
• TRAPR: Trap Conflict Reset
• IOPUWR: Illegal Opcode Reset
• UWR: Uninitialized W Register Reset

A simplified block diagram of the Reset module is shown in Figure 7-1.

Any active source of Reset will make the $\overline{SYSRST}$ signal active. Many registers associated with the CPU and peripherals are forced to a known Reset state. Most registers are unaffected by a Reset; their status is unknown on Power-on Reset (POR) and unchanged by all other Resets.

> **Note:** Refer to the specific peripheral or **Section 3.0 "CPU"** of this data sheet for register Reset states.

All types of device Reset will set a corresponding status bit in the RCON register to indicate the type of Reset (see Register 7-1). A Power-on Reset will clear all bits except for the BOR and POR bits (RCON<1:0>) which are set. The user may set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software will not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer (WDT) and device power-saving states. The function of these bits is discussed in other sections of this manual.

> **Note:** The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset will be meaningful.

**FIGURE 7-1:** **RESET SYSTEM BLOCK DIAGRAM**
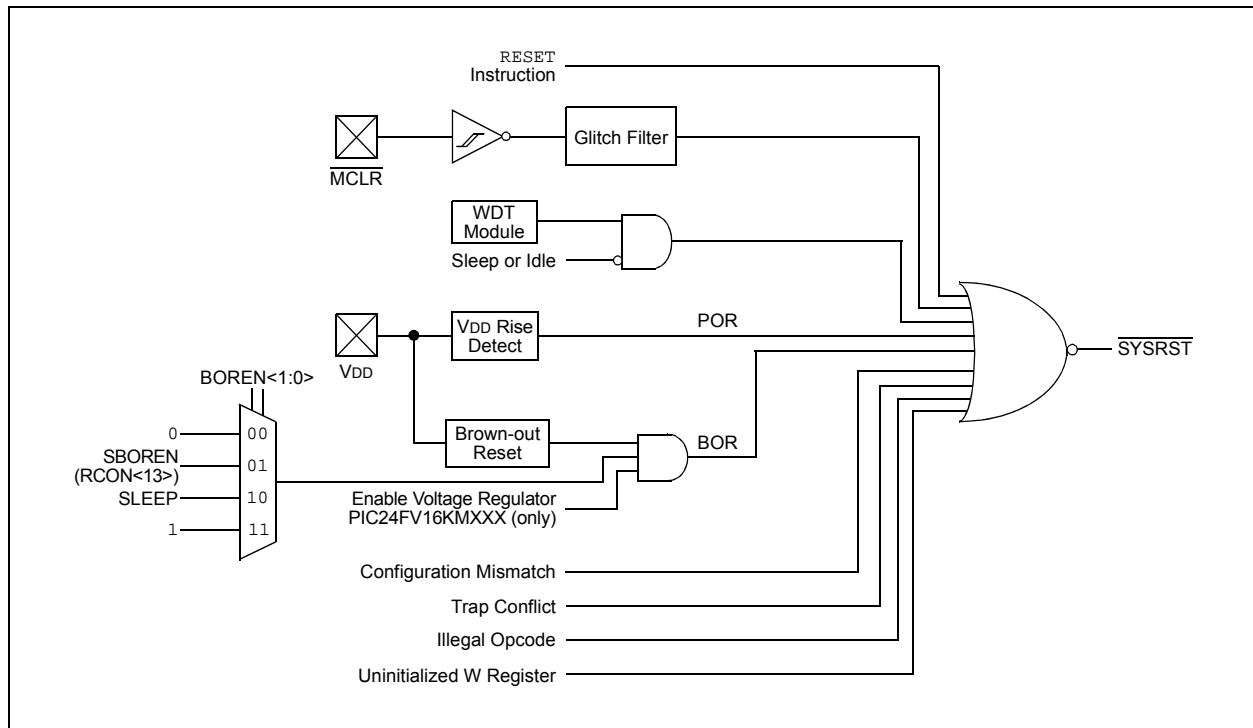

## REGISTER 7-1: RCON: RESET CONTROL REGISTER[1]

| R/W-0, HS | R/W-0, HS | R/W-0 | R/W-0 | U-0 | U-0 | R/W-0 | R/W-0 |
|---|---|---|---|---|---|---|---|
| TRAPR | IOPUWR | SBOREN | RETEN[3] | — | — | CM | PMSLP |
| bit 15 | | | | | | | bit 8 |

| R/W-0, HS | R/W-0, HS | R/W-0, HS | R/W-0, HS | R/W-0, HS | R/W-0, HS | R/W-1, HS | R/W-1, HS |
|---|---|---|---|---|---|---|---|
| EXTR | SWR | SWDTEN[2] | WDTO | SLEEP | IDLE | BOR | POR |
| bit 7 | | | | | | | bit 0 |

| Legend: | | HS = Hardware Settable bit | |
|---|---|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 15　　**TRAPR:** Trap Reset Flag bit

　　　　1 = A Trap Conflict Reset has occurred
　　　　0 = A Trap Conflict Reset has not occurred

bit 14　　**IOPUWR:** Illegal Opcode or Uninitialized W Access Reset Flag bit

　　　　1 = An illegal opcode detection, an illegal address mode or Uninitialized W register used as an Address Pointer caused a Reset
　　　　0 = An illegal opcode or Uninitialized W Reset has not occurred

bit 13　　**SBOREN:** Software Enable/Disable of BOR bit

　　　　1 = BOR is turned on in software
　　　　0 = BOR is turned off in software

bit 12　　**RETEN:** Retention Sleep Mode[3]

　　　　1 = Regulated voltage supply provided by the Retention Regulator (RETREG) during Sleep
　　　　0 = Regulated voltage supply provided by the main Voltage Regulator (VREG) during Sleep

bit 11-10　**Unimplemented:** Read as '0'

bit 9　　**CM:** Configuration Word Mismatch Reset Flag bit

　　　　1 = A Configuration Word Mismatch Reset has occurred
　　　　0 = A Configuration Word Mismatch Reset has not occurred

bit 8　　**PMSLP:** Program Memory Power During Sleep bit

　　　　1 = Program memory bias voltage remains powered during Sleep
　　　　0 = Program memory bias voltage is powered down during Sleep and the voltage regulator enters Standby mode

bit 7　　**EXTR:** External Reset (MCLR) Pin bit

　　　　1 = A Master Clear (pin) Reset has occurred
　　　　0 = A Master Clear (pin) Reset has not occurred

bit 6　　**SWR:** Software RESET (Instruction) Flag bit

　　　　1 = A RESET instruction has been executed
　　　　0 = A RESET instruction has not been executed

bit 5　　**SWDTEN:** Software Enable/Disable of WDT bit[2]

　　　　1 = WDT is enabled
　　　　0 = WDT is disabled

**Note 1:** All of the Reset status bits may be set or cleared in software. Setting one of these bits in software does not cause a device Reset.

**2:** If the FWDTEN<1:0> Configuration bits are '11' (unprogrammed), the WDT is always enabled regardless of the SWDTEN bit setting.

**3:** This is implemented on PIC24FV16KMXXX parts only; not used on PIC24F16KMXXX devices.

## REGISTER 7-1: RCON: RESET CONTROL REGISTER[1] (CONTINUED)

bit 4　　　**WDTO:** Watchdog Timer Time-out Flag bit

　　　　　1 = WDT time-out has occurred
　　　　　0 = WDT time-out has not occurred

bit 3　　　**SLEEP:** Wake-up from Sleep Flag bit

　　　　　1 = Device has been in Sleep mode
　　　　　0 = Device has not been in Sleep mode

bit 2　　　**IDLE:** Wake-up from Idle Flag bit

　　　　　1 = Device has been in Idle mode
　　　　　0 = Device has not been in Idle mode

bit 1　　　**BOR:** Brown-out Reset Flag bit

　　　　　1 = A Brown-out Reset has occurred (the BOR is also set after a POR)
　　　　　0 = A Brown-out Reset has not occurred

bit 0　　　**POR:** Power-on Reset Flag bit

　　　　　1 = A Power-on Reset has occurred
　　　　　0 = A Power-on Reset has not occurred

**Note 1:** All of the Reset status bits may be set or cleared in software. Setting one of these bits in software does not cause a device Reset.

**2:** If the FWDTEN<1:0> Configuration bits are '11' (unprogrammed), the WDT is always enabled regardless of the SWDTEN bit setting.

**3:** This is implemented on PIC24FV16KMXXX parts only; not used on PIC24F16KMXXX devices.

### TABLE 7-1: RESET FLAG BIT OPERATION

| Flag Bit | Setting Event | Clearing Event |
|---|---|---|
| TRAPR (RCON<15>) | Trap Conflict Event | POR |
| IOPUWR (RCON<14>) | Illegal Opcode or Uninitialized W Register Access | POR |
| CM (RCON<9>) | Configuration Mismatch Reset | POR |
| EXTR (RCON<7>) | MCLR Reset | POR |
| SWR (RCON<6>) | RESET Instruction | POR |
| WDTO (RCON<4>) | WDT Time-out | PWRSAV Instruction, POR |
| SLEEP (RCON<3>) | PWRSAV #SLEEP Instruction | POR |
| IDLE (RCON<2>) | PWRSAV #IDLE Instruction | POR |
| BOR (RCON<1>) | POR, BOR | — |
| POR (RCON<0>) | POR | — |

**Note:** All Reset flag bits may be set or cleared by the user software.

# PIC24FV16KM204 FAMILY

## 7.1 Clock Source Selection at Reset

If clock switching is enabled, the system clock source at device Reset is chosen, as shown in Table 7-2. If clock switching is disabled, the system clock source is always selected according to the Oscillator Configuration bits. For more information, see **Section 9.0 "Oscillator Configuration"**.

### TABLE 7-2: OSCILLATOR SELECTION vs. TYPE OF RESET (CLOCK SWITCHING ENABLED)

| Reset Type | Clock Source Determinant |
|---|---|
| POR | FNOSC<2:0> Configuration bits (FOSCSEL<2:0>) |
| BOR | |
| $\overline{\text{MCLR}}$ | COSC<2:0> Control bits (OSCCON<14:12>) |
| WDTO | |
| SWR | |

## 7.2 Device Reset Times

The Reset times for various types of device Reset are summarized in Table 7-3. Note that the system Reset signal, $\overline{\text{SYSRST}}$, is released after the POR and PWRT delay times expire.

The time at which the device actually begins to execute code will also depend on the system oscillator delays, which include the Oscillator Start-up Timer (OST) and the PLL lock time. The OST and PLL lock times occur in parallel with the applicable $\overline{\text{SYSRST}}$ delay times.

The FSCM delay determines the time at which the FSCM begins to monitor the system clock source after the $\overline{\text{SYSRST}}$ signal is released.

### TABLE 7-3: RESET DELAY TIMES FOR VARIOUS DEVICE RESETS

| Reset Type | Clock Source | $\overline{\text{SYSRST}}$ Delay | System Clock Delay | Notes |
|---|---|---|---|---|
| POR[6] | EC | $T_{POR} + T_{PWRT}$ | — | **1, 2** |
| | FRC, FRCDIV | $T_{POR} + T_{PWRT}$ | $T_{FRC}$ | **1, 2, 3** |
| | LPRC | $T_{POR} + T_{PWRT}$ | $T_{LPRC}$ | **1, 2, 3** |
| | ECPLL | $T_{POR} + T_{PWRT}$ | $T_{LOCK}$ | **1, 2, 4** |
| | FRCPLL | $T_{POR} + T_{PWRT}$ | $T_{FRC} + T_{LOCK}$ | **1, 2, 3, 4** |
| | XT, HS, SOSC | $T_{POR} + T_{PWRT}$ | $T_{OST}$ | **1, 2, 5** |
| | XTPLL, HSPLL | $T_{POR} + T_{PWRT}$ | $T_{OST} + T_{LOCK}$ | **1, 2, 4, 5** |
| BOR | EC | $T_{PWRT}$ | — | **2** |
| | FRC, FRCDIV | $T_{PWRT}$ | $T_{FRC}$ | **2, 3** |
| | LPRC | $T_{PWRT}$ | $T_{LPRC}$ | **2, 3** |
| | ECPLL | $T_{PWRT}$ | $T_{LOCK}$ | **2, 4** |
| | FRCPLL | $T_{PWRT}$ | $T_{FRC} + T_{LOCK}$ | **2, 3, 4** |
| | XT, HS, SOSC | $T_{PWRT}$ | $T_{OST}$ | **2, 5** |
| | XTPLL, HSPLL | $T_{PWRT}$ | $T_{FRC} + T_{LOCK}$ | **2, 3, 4** |
| All Others | Any Clock | — | — | **None** |

**Note 1:** $T_{POR}$ = Power-on Reset delay.
  **2:** $T_{PWRT}$ = 64 ms nominal if the Power-up Timer is enabled; otherwise, it is zero.
  **3:** $T_{FRC}$ and $T_{LPRC}$ = RC Oscillator start-up times.
  **4:** $T_{LOCK}$ = PLL Lock time.
  **5:** $T_{OST}$ = Oscillator Start-up Timer (OST). A 10-bit counter waits 1024 oscillator periods before releasing the oscillator clock to the system.
  **6:** If Two-Speed Start-up is enabled, regardless of the Primary Oscillator selected, the device starts with FRC, and in such cases, FRC start-up time is valid.

**Note:** For detailed operating frequency and timing specifications, see **Section 27.0 "Electrical Characteristics"**.

### 7.2.1 POR AND LONG OSCILLATOR START-UP TIMES

The oscillator start-up circuitry and its associated delay timers are not linked to the device Reset delays that occur at power-up. Some crystal circuits (especially low-frequency crystals) will have a relatively long start-up time. Therefore, one or more of the following conditions is possible after $\overline{\text{SYSRST}}$ is released:

• The oscillator circuit has not begun to oscillate.
• The Oscillator Start-up Timer (OST) has not expired (if a crystal oscillator is used).
• The PLL has not achieved a lock (if PLL is used).

The device will not begin to execute code until a valid clock source has been released to the system. Therefore, the oscillator and PLL start-up delays must be considered when the Reset delay time must be known.

### 7.2.2 FAIL-SAFE CLOCK MONITOR (FSCM) AND DEVICE RESETS

If the FSCM is enabled, it will begin to monitor the system clock source when $\overline{\text{SYSRST}}$ is released. If a valid clock source is not available at this time, the device will automatically switch to the FRC Oscillator and the user can switch to the desired crystal oscillator in the Trap Service Routine (TSR).

## 7.3 Special Function Register Reset States

Most of the Special Function Registers (SFRs) associated with the PIC24F CPU and peripherals are reset to a particular value at a device Reset. The SFRs are grouped by their peripheral or CPU function and their Reset values are specified in each section of this manual.

The Reset value for each SFR does not depend on the type of Reset, with the exception of four registers. The Reset value for the Reset Control register, RCON, will depend on the type of device Reset. The Reset value for the Oscillator Control register, OSCCON, will depend on the type of Reset and the programmed values of the FNOSCx bits in the Flash Configuration Word (FOSCSEL<2:0>); see Table 7-2. The RCFGCAL and NVMCON registers are only affected by a POR.

## 7.4 Brown-out Reset (BOR)

The PIC24FXXXXX family devices implement a BOR circuit, which provides the user several configuration and power-saving options. The BOR is controlled by the BORV<1:0> and BOREN<1:0> Configuration bits (FPOR<6:5,1:0>). There are a total of four BOR configurations, which are provided in Table 7-3.

The BOR threshold is set by the BORV<1:0> bits. If BOR is enabled (any values of BOREN<1:0>, except '00'), any drop of VDD below the set threshold point will reset the device. The chip will remain in BOR until VDD rises above the threshold.

If the Power-up Timer is enabled, it will be invoked after VDD rises above the threshold. Then, it will keep the chip in Reset for an additional time delay, TPWRT, if VDD drops below the threshold while the Power-up Timer is running. The chip goes back into a BOR and the Power-up Timer will be initialized. Once VDD rises above the threshold, the Power-up Timer will execute the additional time delay.

BOR and the Power-up Timer (PWRT) are independently configured. Enabling the Brown-out Reset does not automatically enable the PWRT.

### 7.4.1 LOW-POWER BOR (LPBOR)

The Low-Power BOR is an alternate setting for the BOR, designed to consume minimal power. In LPBOR mode, BORV<1:0> (FPOR<6:5>) = 00. The BOR trip point is approximately 2.0V. Due to the low current consumption, the accuracy of the LPBOR mode can vary.

Unlike the other BOR modes, LPBOR mode will not cause a device Reset when VDD drops below the trip point. Instead, it re-arms the POR circuit to ensure that the device will reset properly in the event that VDD continues to drop below the minimum operating voltage.

The device will continue to execute code when VDD is below the level of the LPBOR trip point. A device that requires falling edge BOR protection to prevent code from improperly executing should use one of the other BOR voltage settings.

---

### 7.4.2 SOFTWARE ENABLED BOR

When BOREN<1:0> = `01`, the BOR can be enabled or disabled by the user in software. This is done with the control bit, SBOREN (RCON<13>). Setting SBOREN enables the BOR to function as previously described. Clearing the SBOREN disables the BOR entirely. The SBOREN bit operates only in this mode; otherwise, it is read as '`0`'.

Placing BOR under software control gives the user the additional flexibility of tailoring the application to its environment without having to reprogram the device to change the BOR configuration. It also allows the user to tailor the incremental current that the BOR consumes. While the BOR current is typically very small, it may have some impact in low-power applications.

| Note: | Even when the BOR is under software control, the Brown-out Reset voltage level is still set by the BORV<1:0> Configuration bits; it can not be changed in software. |
|---|---|

### 7.4.3 DETECTING BOR

When BOR is enabled, the BOR bit (RCON<1>) is always reset to '`1`' on any BOR or POR event. This makes it difficult to determine if a BOR event has occurred just by reading the state of BOR alone. A more reliable method is to simultaneously check the state of both POR and BOR. This assumes that the POR and BOR bits are reset to '`0`' in the software immediately after any POR event. If the BOR bit is '`1`' while POR is '`0`', it can be reliably assumed that a BOR event has occurred.

### 7.4.4 DISABLING BOR IN SLEEP MODE

When BOREN<1:0> = `10`, BOR remains under hardware control and operates as previously described. However, whenever the device enters Sleep mode, BOR is automatically disabled. When the device returns to any other operating mode, BOR is automatically re-enabled.

This mode allows for applications to recover from brown-out situations, while actively executing code, when the device requires BOR protection the most. At the same time, it saves additional power in Sleep mode by eliminating the small incremental BOR current.

| Note: | BOR levels differ depending on device type; PIC24FV16KM204 devices are at different levels than those of PIC24F16KM204 devices. See **Section 27.0 "Electrical Characteristics"** for BOR voltage levels. |
|---|---|

## 8.0 INTERRUPT CONTROLLER

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Interrupt Controller, refer to the *"PIC24F Family Reference Manual"*, **"Interrupts"** (DS39707).

The PIC24F interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the CPU. It has the following features:

- Up to Eight Processor Exceptions and Software Traps
- Seven User-Selectable Priority Levels
- Interrupt Vector Table (IVT) with up to 118 Vectors
- Unique Vector for Each Interrupt or Exception Source
- Fixed Priority within a Specified User Priority Level
- Alternate Interrupt Vector Table (AIVT) for Debug Support
- Fixed Interrupt Entry and Return Latencies

### 8.1 Interrupt Vector Table (IVT)

The IVT is shown in Figure 8-1. The IVT resides in the program memory, starting at location, 000004h. The IVT contains 126 vectors, consisting of eight non-maskable trap vectors, plus up to 118 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit-wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority; this is linked to their position in the vector table. All other things being equal, lower addresses have a higher natural priority. For example, the interrupt associated with Vector 0 will take priority over interrupts at any other vector address.

PIC24FV16KM204 family devices implement non-maskable traps and unique interrupts; these are summarized in Table 8-1.

### 8.1.1 ALTERNATE INTERRUPT VECTOR TABLE (AIVT)

The Alternate Interrupt Vector Table (AIVT) is located after the IVT, as shown in Figure 8-1. Access to the AIVT is provided by the ALTIVT control bit (INTCON2<15>). If the ALTIVT bit is set, all interrupt and exception processes will use the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

The AIVT supports emulation and debugging efforts by providing a means to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time. If the AIVT is not needed, the AIVT should be programmed with the same addresses used in the IVT.

### 8.2 Reset Sequence

A device Reset is not a true exception, because the interrupt controller is not involved in the Reset process. The PIC24F devices clear their registers in response to a Reset, which forces the Program Counter (PC) to zero. The microcontroller then begins program execution at location, 000000h. The user programs a GOTO instruction at the Reset address, which redirects the program execution to the appropriate start-up routine.

> **Note:** Any unimplemented or unused vector locations in the IVT and AIVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

## 8.3 Interrupt Control and Status Registers

The PIC24FV16KM204 family of devices implements a total of 33 registers for the interrupt controller:

- INTCON1
- INTCON2
- IFS0 through IFS6
- IEC0 through IEC6
- IPC0 through IPC7, IPC10, IPC12, IPC15, IPC16, IPC18 through IPC20 and IPC24
- INTTREG

Global Interrupt Enable (GIE) control functions are controlled from INTCON1 and INTCON2. INTCON1 contains the Interrupt Nesting Disable (NSTDIS) bit, as well as the control and status flags for the processor trap sources. The INTCON2 register controls the external interrupt request signal behavior and the use of the AIVT.

The IFSx registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals, or external signal, and is cleared via software.

The IECx registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

The IPCx registers are used to set the Interrupt Priority Level (IPL) for each source of interrupt. Each user interrupt source can be assigned to one of eight priority levels.

The INTTREG register contains the associated interrupt vector number and the new CPU Interrupt Priority Level, which are latched into the Vector Number (VECNUM<6:0>) and the Interrupt Level (ILR<3:0>) bit fields in the INTTREG register. The new Interrupt Priority Level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence. For example, the INT0 (External Interrupt 0) is depicted as having a vector number and a natural order priority of 0. The INT0IF status bit is found in IFS0<0>, the INT0IE enable bit in IEC0<0> and the INT0IP<2:0> priority bits are in the first position of IPC0 (IPC0<2:0>).

Although they are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality. The ALU STATUS Register (SR) contains the IPL<2:0> bits (SR<7:5>). These indicate the current CPU Interrupt Priority Level. The user may change the current CPU Interrupt Priority Level by writing to the IPLx bits.

The CORCON register contains the IPL3 bit, which together with IPL<2:0>, also indicates the current CPU Interrupt Priority Level. IPL3 is a read-only bit so that the trap events cannot be masked by the user's software.

All Interrupt registers are described in Register 8-1 through Register 8-35, in the following sections.

**REGISTER 8-1:**     **SR: ALU STATUS REGISTER**

| U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | R-0, HSC |
|-----|-----|-----|-----|-----|-----|-----|----------|
| — | — | — | — | — | — | — | DC[1] |

bit 15                                                       bit 8

| R/W-0, HSC | R/W-0, HSC | R/W-0, HSC | R-0, HSC | R/W-0, HSC | R/W-0, HSC | R/W-0, HSC | R/W-0, HSC |
|------------|------------|------------|----------|------------|------------|------------|------------|
| IPL2[2,3] | IPL1[2,3] | IPL0[2,3] | RA[1] | N[1] | OV[1] | Z[1] | C[1] |

bit 7                                                       bit 0

| Legend: | | HSC = Hardware Settable/Clearable bit | |
|---------|---|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 15-9     **Unimplemented:** Read as '0'

bit 7-5     **IPL<2:0>:** CPU Interrupt Priority Level Status bits[2,3]

                 111 = CPU Interrupt Priority Level is 7 (15); user interrupts are disabled
                 110 = CPU Interrupt Priority Level is 6 (14)
                 101 = CPU Interrupt Priority Level is 5 (13)
                 100 = CPU Interrupt Priority Level is 4 (12)
                 011 = CPU Interrupt Priority Level is 3 (11)
                 010 = CPU Interrupt Priority Level is 2 (10)
                 001 = CPU Interrupt Priority Level is 1 (9)
                 000 = CPU Interrupt Priority Level is 0 (8)

**Note 1:**     See Register 3-1 for the description of these bits, which are not dedicated to interrupt control functions.

      **2:**     The IPL<2:0> bits are concatenated with the IPL3 bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the Interrupt Priority Level if IPL3 = 1.

      **3:**     The IPLx Status bits are read-only when NSTDIS (INTCON1<15>) = 1.

> **Note:**     Bit 8 and bits 4 through 0 are described in **Section 3.0 "CPU"**.

bit 15 **CPUIRQ:** Interrupt Request from Interrupt Controller CPU bit

1 = An interrupt request has occurred but has not yet been Acknowledged by the CPU (this will happen when the CPU priority is higher than the interrupt priority)
0 = No interrupt request is left unacknowledged

bit 14 **Unimplemented:** Read as '0'

bit 13 **VHOLD:** Vector Hold bit

Allows Vector Number Capture and Changes which Interrupt is Stored in the VECNUM<6:0> bits:
1 = VECNUM<6:0> will contain the value of the highest priority pending interrupt, instead of the current interrupt
0 = VECNUM<6:0> will contain the value of the last Acknowledged interrupt (last interrupt that has occurred with higher priority than the CPU, even if other interrupts are pending)

bit 12 **Unimplemented:** Read as '0'

bit 11-8 **ILR<3:0>:** New CPU Interrupt Priority Level bits

1111 = CPU Interrupt Priority Level is 15
•
•
•
0001 = CPU Interrupt Priority Level is 1
0000 = CPU Interrupt Priority Level is 0

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **VECNUM<6:0>:** Vector Number of Pending Interrupt bits

0111111 = Interrupt vector pending is Number 135
•
•
•
0000001 = Interrupt vector pending is Number 9
0000000 = Interrupt vector pending is Number 8

## 8.4    Interrupt Setup Procedures

### 8.4.1    INITIALIZATION

To configure an interrupt source:

1. Set the NSTDIS control bit (INTCON1<15>) if nested interrupts are not desired.
2. Select the user-assigned priority level for the interrupt source by writing the control bits in the appropriate IPCx register. The priority level will depend on the specific application and type of interrupt source. If multiple priority levels are not desired, the IPCx register control bits for all enabled interrupt sources may be programmed to the same non-zero value.

> **Note:**    At a device Reset, the IPCx registers are initialized, such that all user interrupt sources are assigned to Priority Level 4.

3. Clear the interrupt flag status bit associated with the peripheral in the associated IFSx register.
4. Enable the interrupt source by setting the interrupt enable control bit associated with the source in the appropriate IECx register.

### 8.4.2    INTERRUPT SERVICE ROUTINE

The method that is used to declare an ISR (Interrupt Service Routine) and initialize the IVT with the correct vector address depends on the programming language (i.e., C or assembly), and the language development toolsuite that is used to develop the application. In general, the user must clear the interrupt flag in the appropriate IFSx register for the source of the interrupt that the ISR handles. Otherwise, the ISR will be re-entered immediately after exiting the routine. If the ISR is coded in assembly language, it must be terminated using a RETFIE instruction to unstack the saved PC value, SRL value and old CPU priority level.

### 8.4.3    TRAP SERVICE ROUTINE (TSR)

A Trap Service Routine (TSR) is coded like an ISR, except that the appropriate trap status flag in the INTCON1 register must be cleared to avoid re-entry into the TSR.

### 8.4.4    INTERRUPT DISABLE

All user interrupts can be disabled using the following procedure:

1. Push the current SR value onto the software stack using the PUSH instruction.
2. Force the CPU to Priority Level 7 by inclusive ORing the value, 0Eh, with SRL.

To enable user interrupts, the POP instruction may be used to restore the previous SR value.

Only user interrupts with a priority level of 7 or less can be disabled. Trap sources (Levels 8-15) cannot be disabled.

The DISI instruction provides a convenient way to disable interrupts of Priority Levels 1-6 for a fixed period. Level 7 interrupt sources are not disabled by the DISI instruction.

**NOTES:**

## 9.0 OSCILLATOR CONFIGURATION

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on oscillator configuration, refer to the *"PIC24F Family Reference Manual"*, **"Oscillator with 500 kHz Low-Power FRC"** (DS39726).

The oscillator system for the PIC24FV16KM204 family of devices has the following features:

- A total of five external and internal oscillator options as clock sources, providing 11 different clock modes.

- On-chip 4x Phase Locked Loop (PLL) to boost internal operating frequency on select internal and external oscillator sources.
- Software-controllable switching between various clock sources.
- Software-controllable postscaler for selective clocking of CPU for system power savings.
- System frequency range declaration bits for External Clock (EC) mode. When using an EC source, the current consumption is reduced by setting the declaration bits to the expected frequency range.
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and permits safe application recovery or shutdown.

A simplified diagram of the oscillator system is shown in Figure 9-1.

**FIGURE 9-1: PIC24FXXXXX FAMILY CLOCK DIAGRAM**
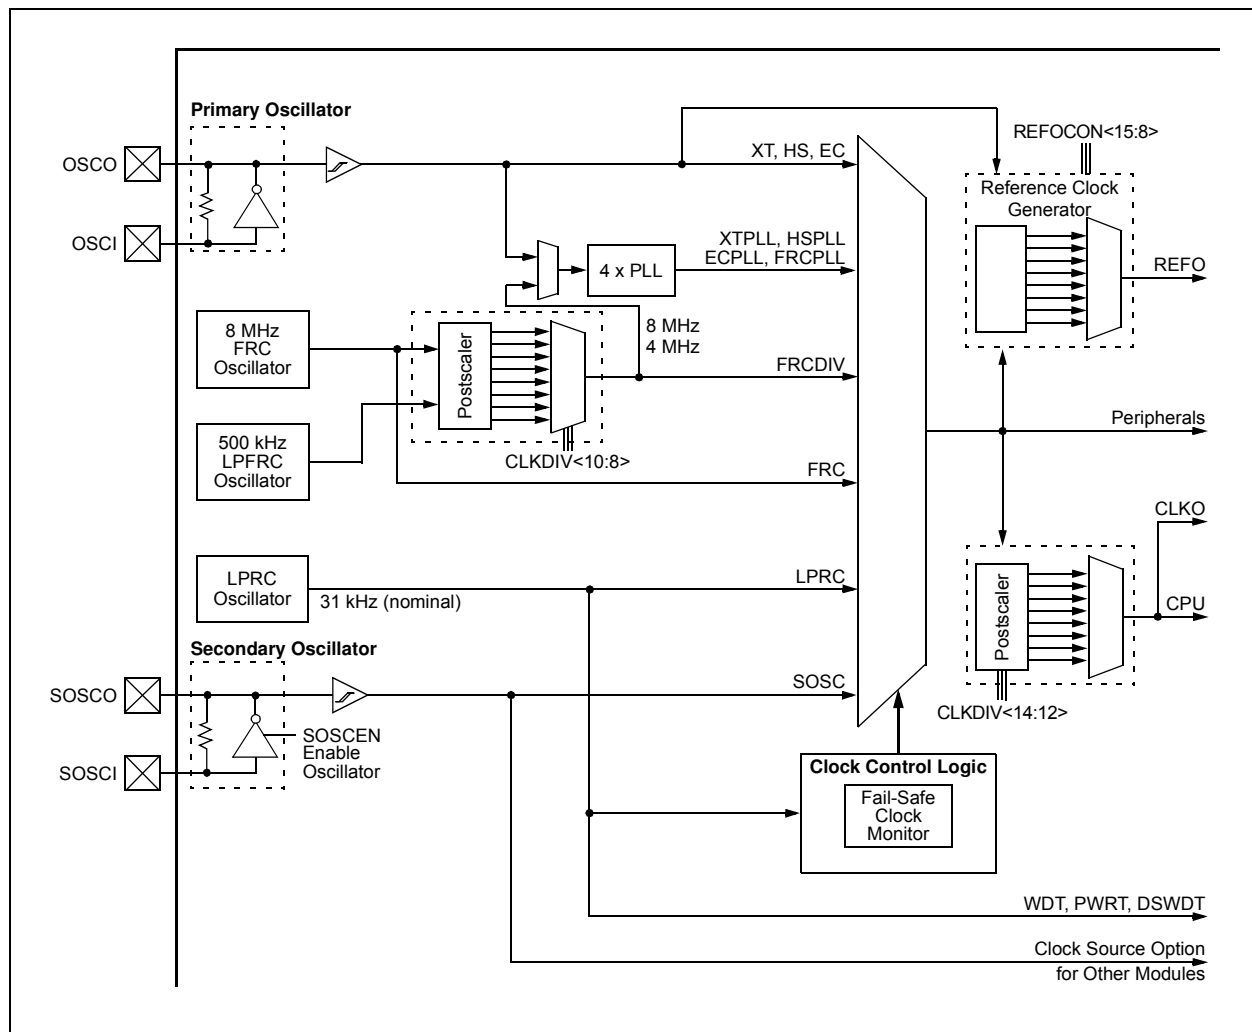

## 9.1 CPU Clocking Scheme

The system clock source can be provided by one of four sources:

- Primary Oscillator (POSC) on the OSCI and OSCO pins
- Secondary Oscillator (SOSC) on the SOSCI and SOSCO pins

  The PIC24FXXXXX family devices consist of two types of secondary oscillator:

  - High-Power Secondary Oscillator
  - Low-Power Secondary Oscillator

  These can be selected by using the SOSCSEL (FOSC<5>) bit.

- Fast Internal RC (FRC) Oscillator:
  - 8 MHz FRC Oscillator
  - 500 kHz Lower Power FRC Oscillator
- Low-Power Internal RC (LPRC) Oscillator with two modes:
  - High-Power/High-Accuracy mode
  - Low-Power/Low-Accuracy mode

The Primary Oscillator and 8 MHz FRC sources have the option of using the internal 4x PLL. The frequency of the FRC clock source can optionally be reduced by the programmable clock divider. The selected clock source generates the processor and peripheral clock sources.

The processor clock source is divided by two to produce the internal instruction cycle clock, $F_{CY}$. In this document, the instruction cycle clock is also denoted by $F_{OSC}/2$. The internal instruction cycle clock, $F_{OSC}/2$, can be provided on the OSCO I/O pin for some operating modes of the Primary Oscillator.

## 9.2 Initial Configuration on POR

The oscillator source (and operating mode) that is used at a device Power-on Reset (POR) event is selected using Configuration bit settings. The Oscillator Configuration bit settings are located in the Configuration registers in the program memory (for more information, see **Section 25.1 "Configuration Bits"**). The Primary Oscillator Configuration bits, POSCMD<1:0> (FOSC<1:0>), and the Initial Oscillator Select Configuration bits, FNOSC<2:0> (FOSCSEL<2:0>), select the oscillator source that is used at a POR. The FRC Primary Oscillator with Postscaler (FRCDIV) is the default (unprogrammed) selection. The Secondary Oscillator, or one of the internal oscillators, may be chosen by programming these bit locations. The EC mode Frequency Range Configuration bits, POSCFREQ<1:0> (FOSC<4:3>), optimize power consumption when running in EC mode. The default configuration is "frequency range is greater than 8 MHz".

The Configuration bits allow users to choose between the various clock modes, shown in Table 9-1.

### 9.2.1 CLOCK SWITCHING MODE CONFIGURATION BITS

The FCKSM<1:0> Configuration bits (FOSC<7:6>) are used jointly to configure device clock switching and the FSCM. Clock switching is enabled only when FCKSM1 is programmed ('0'). The FSCM is enabled only when FCKSM<1:0> are both programmed ('00').

**TABLE 9-1: CONFIGURATION BIT VALUES FOR CLOCK SELECTION**

| Oscillator Mode | Oscillator Source | POSCMD<1:0> | FNOSC<2:0> | Notes |
|---|---|---|---|---|
| 8 MHz FRC Oscillator with Postscaler (FRCDIV) | Internal | 11 | 111 | **1, 2** |
| 500 kHz FRC Oscillator with Postscaler (LPFRCDIV) | Internal | 11 | 110 | **1** |
| Low-Power RC Oscillator (LPRC) | Internal | 11 | 101 | **1** |
| Secondary (Timer1) Oscillator (SOSC) | Secondary | 00 | 100 | **1** |
| Primary Oscillator (HS) with PLL Module (HSPLL) | Primary | 10 | 011 | |
| Primary Oscillator (EC) with PLL Module (ECPLL) | Primary | 00 | 011 | |
| Primary Oscillator (HS) | Primary | 10 | 010 | |
| Primary Oscillator (XT) | Primary | 01 | 010 | |
| Primary Oscillator (EC) | Primary | 00 | 010 | |
| 8 MHz FRC Oscillator with PLL Module (FRCPLL) | Internal | 11 | 001 | **1** |
| 8 MHz FRC Oscillator (FRC) | Internal | 11 | 000 | **1** |

**Note 1:** The OSCO pin function is determined by the OSCIOFNC Configuration bit.

**2:** This is the default oscillator mode for an unprogrammed (erased) device.

## 9.3 Control Registers

The operation of the oscillator is controlled by three Special Function Registers (SFRs):

• OSCCON
• CLKDIV
• OSCTUN

The OSCCON register (Register 9-1) is the main control register for the oscillator. It controls clock source switching and allows the monitoring of clock sources.

The Clock Divider register (Register 9-2) controls the features associated with Doze mode, as well as the postscaler for the FRC Oscillator.

The FRC Oscillator Tune register (Register 9-3) allows the user to fine-tune the FRC Oscillator over a range of approximately ±5.25%. Each bit increment or decrement changes the factory calibrated frequency of the FRC Oscillator by a fixed amount.

### REGISTER 9-1: OSCCON: OSCILLATOR CONTROL REGISTER

| U-0 | R-0, HSC | R-0, HSC | R-0, HSC | U-0 | R/W-x[1] | R/W-x[1] | R/W-x[1] |
|---|---|---|---|---|---|---|---|

| bit 15 | | | | | | | bit 8 |

| R/SO-0, HSC | U-0 | R-0, HSC[2] | U-0 | R/CO-0, HS | R/W-0[3] | R/W-0 | R/W-0 |
|---|---|---|---|---|---|---|---|
| CLKLOCK | — | LOCK | — | CF | SOSCDRV | SOSCEN | OSWEN |
| bit 7 | | | | | | | bit 0 |

| Legend: | | HSC = Hardware Settable/Clearable bit | |
|---|---|---|---|
| HS = Hardware Settable bit | CO = Clearable Only bit | SO = Settable Only bit | |
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 15 **Unimplemented:** Read as '0'

bit 14-12 **COSC<2:0>:** Current Oscillator Selection bits

111 = 8 MHz Fast RC Oscillator with Postscaler (FRCDIV)
110 = 500 kHz Low-Power Fast RC Oscillator (FRC) with Postscaler (LPFRCDIV)
101 = Low-Power RC Oscillator (LPRC)
100 = Secondary Oscillator (SOSC)
011 = Primary Oscillator with PLL module (XTPLL, HSPLL, ECPLL)
010 = Primary Oscillator (XT, HS, EC)
001 = 8 MHz FRC Oscillator with Postscaler and PLL module (FRCPLL)
000 = 8 MHz FRC Oscillator (FRC)

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **NOSC<2:0>:** New Oscillator Selection bits[1]

111 = 8 MHz Fast RC Oscillator with Postscaler (FRCDIV)
110 = 500 kHz Low-Power Fast RC Oscillator (FRC) with Postscaler (LPFRCDIV)
101 = Low-Power RC Oscillator (LPRC)
100 = Secondary Oscillator (SOSC)
011 = Primary Oscillator with PLL module (XTPLL, HSPLL, ECPLL)
010 = Primary Oscillator (XT, HS, EC)
001 = 8 MHz FRC Oscillator with Postscaler and PLL module (FRCPLL)
000 = 8 MHz FRC Oscillator (FRC)

**Note 1:** Reset values for these bits are determined by the FNOSCx Configuration bits.

**2:** This bit also resets to '0' during any valid clock switch or whenever a non-PLL Clock mode is selected.

**3:** When SOSC is selected to run from a digital clock input, rather than an external crystal (SOSCSRC = 0), this bit has no effect.

**REGISTER 9-1:** **OSCCON: OSCILLATOR CONTROL REGISTER (CONTINUED)**

bit 7 **CLKLOCK:** Clock Selection Lock Enable bit

If FSCM is Enabled (FCKSM1 = 1):

1 = Clock and PLL selections are locked

0 = Clock and PLL selections are not locked and may be modified by setting the OSWEN bit

If FSCM is Disabled (FCKSM1 = 0):

Clock and PLL selections are never locked and may be modified by setting the OSWEN bit.

bit 6 **Unimplemented:** Read as '0'

bit 5 **LOCK:** PLL Lock Status bit[2]

1 = PLL module is in lock or PLL module start-up timer is satisfied

0 = PLL module is out of lock, PLL start-up timer is running or PLL is disabled

bit 4 **Unimplemented:** Read as '0'

bit 3 **CF:** Clock Fail Detect bit

1 = FSCM has detected a clock failure

0 = No clock failure has been detected

bit 2 **SOSCDRV**: Secondary Oscillator Drive Strength bit[3]

1 = High-power SOSC circuit is selected

0 = Low/high-power select is done via the SOSCSRC Configuration bit

bit 1 **SOSCEN:** 32 kHz Secondary Oscillator (SOSC) Enable bit

1 = Enables the Secondary Oscillator

0 = Disables the Secondary Oscillator

bit 0 **OSWEN:** Oscillator Switch Enable bit

1 = Initiates an oscillator switch to the clock source specified by the NOSC<2:0> bits

0 = Oscillator switch is complete

**Note 1:** Reset values for these bits are determined by the FNOSCx Configuration bits.

**2:** This bit also resets to '0' during any valid clock switch or whenever a non-PLL Clock mode is selected.

**3:** When SOSC is selected to run from a digital clock input, rather than an external crystal (SOSCSRC = 0), this bit has no effect.

**REGISTER 9-2: CLKDIV: CLOCK DIVIDER REGISTER**

bit 15 **ROI:** Recover on Interrupt bit

1 = Interrupts clear the DOZEN bit, and reset the CPU and peripheral clock ratio to 1:1
0 = Interrupts have no effect on the DOZEN bit

bit 14-12 **DOZE<2:0>:** CPU and Peripheral Clock Ratio Select bits

111 = 1:128
110 = 1:64
101 = 1:32
100 = 1:16
011 = 1:8
010 = 1:4
001 = 1:2
000 = 1:1

bit 11 **DOZEN:** Doze Enable bit[1]

1 = DOZE<2:0> bits specify the CPU and peripheral clock ratio
0 = CPU and peripheral clock ratio are set to 1:1

bit 10-8 **RCDIV<2:0>:** FRC Postscaler Select bits

When COSC<2:0> (OSCCON<14:12>) = 111:
111 = 31.25 kHz (divide-by-256)
110 = 125 kHz (divide-by-64)
101 = 250 kHz (divide-by-32)
100 = 500 kHz (divide-by-16)
011 = 1 MHz (divide-by-8)
010 = 2 MHz (divide-by-4)
001 = 4 MHz (divide-by-2) – default
000 = 8 MHz (divide-by-1)
When COSC<2:0> (OSCCON<14:12>) = 110:
111 = 1.95 kHz (divide-by-256)
110 = 7.81 kHz (divide-by-64)
101 = 15.62 kHz (divide-by-32)
100 = 31.25 kHz (divide-by-16)
011 = 62.5 kHz (divide-by-8)
010 = 125 kHz (divide-by-4)
001 = 250 kHz (divide-by-2) – default
000 = 500 kHz (divide-by-1)

bit 7-0 **Unimplemented:** Read as '0'

**Note 1:** This bit is automatically cleared when the ROI bit is set and an interrupt occurs.

`000001`
`000000` = Center frequency, oscillator is running at factory calibrated frequency
`111111`
•
•
•
`100001`
`100000` = Minimum frequency deviation

**Note 1:** Increments or decrements of TUN<5:0> may not change the FRC frequency in equal steps over the FRC tuning range and may not be monotonic.

## 9.4 Clock Switching Operation

With few limitations, applications are free to switch between any of the four clock sources (POSC, SOSC, FRC and LPRC) under software control and at any time. To limit the possible side effects that could result from this flexibility, PIC24F devices have a safeguard lock built into the switching process.

> **Note:** The Primary Oscillator mode has three different submodes (XT, HS and EC), which are determined by the POSCMDx Configuration bits. While an application can switch to and from Primary Oscillator mode in software, it cannot switch between the different primary submodes without reprogramming the device.

### 9.4.1 ENABLING CLOCK SWITCHING

To enable clock switching, the FCKSM1 Configuration bit in the FOSC Configuration register must be programmed to '0'. (Refer to **Section 25.0 "Special Features"** for further details.) If the FCKSM1 Configuration bit is unprogrammed ('1'), the clock switching function and FSCM function are disabled; this is the default setting.

The NOSCx control bits (OSCCON<10:8>) do not control the clock selection when clock switching is disabled. However, the COSCx bits (OSCCON<14:12>) will reflect the clock source selected by the FNOSCx Configuration bits.

The OSWEN control bit (OSCCON<0>) has no effect when clock switching is disabled; it is held at '0' at all times.

### 9.4.2 OSCILLATOR SWITCHING SEQUENCE

At a minimum, performing a clock switch requires this basic sequence:

1. If desired, read the COSCx bits (OSCCON<14:12>) to determine the current oscillator source.
2. Perform the unlock sequence to allow a write to the OSCCON register high byte.
3. Write the appropriate value to the NOSCx bits (OSCCON<10:8>) for the new oscillator source.
4. Perform the unlock sequence to allow a write to the OSCCON register low byte.
5. Set the OSWEN bit to initiate the oscillator switch.

Once the basic sequence is completed, the system clock hardware responds automatically, as follows:

1. The clock switching hardware compares the COSCx bits with the new value of the NOSCx bits. If they are the same, then the clock switch is a redundant operation. In this case, the OSWEN bit is cleared automatically and the clock switch is aborted.
2. If a valid clock switch has been initiated, the LOCK (OSCCON<5>) and CF (OSCCON<3>) bits are cleared.
3. The new oscillator is turned on by the hardware if it is not currently running. If a crystal oscillator must be turned on, the hardware will wait until the OST expires. If the new source is using the PLL, then the hardware waits until a PLL lock is detected (LOCK = 1).
4. The hardware waits for 10 clock cycles from the new clock source and then performs the clock switch.
5. The hardware clears the OSWEN bit to indicate a successful clock transition. In addition, the NOSCx bits value is transferred to the COSCx bits.
6. The old clock source is turned off at this time, with the exception of LPRC (if WDT, FSCM or RTCC with LPRC as a clock source is enabled) or SOSC (if SOSCEN remains enabled).

> **Note 1:** The processor will continue to execute code throughout the clock switching sequence. Timing-sensitive code should not be executed during this time.
>
> **2:** Direct clock switches between any Primary Oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transitional clock source between the two PLL modes.

---

The following code sequence for a clock switch is recommended:

1. Disable interrupts during the OSCCON register unlock and write sequence.

2. Execute the unlock sequence for the OSCCON high byte by writing 78h and 9Ah to OSCCON<15:8>, in two back-to-back instructions.

3. Write the new oscillator source to the NOSCx bits in the instruction immediately following the unlock sequence.

4. Execute the unlock sequence for the OSCCON low byte by writing 46h and 57h to OSCCON<7:0>, in two back-to-back instructions.

5. Set the OSWEN bit in the instruction immediately following the unlock sequence.

6. Continue to execute code that is not clock-sensitive (optional).

7. Invoke an appropriate amount of software delay (cycle counting) to allow the selected oscillator and/or PLL to start and stabilize.

8. Check to see if OSWEN is '0'. If it is, the switch was successful. If OSWEN is still set, then check the LOCK bit to determine the cause of failure.

The core sequence for unlocking the OSCCON register and initiating a clock switch is shown in Example 9-1 and Example 9-2.

**EXAMPLE 9-1: ASSEMBLY CODE SEQUENCE FOR CLOCK SWITCHING**

```
;Place the new oscillator selection in W0
;OSCCONH (high byte) Unlock Sequence
MOV        #OSCCONH, w1
MOV        #0x78, w2
MOV        #0x9A, w3
MOV.b      w2, [w1]
MOV.b      w3, [w1]
;Set new oscillator selection
MOV.b      WREG, OSCCONH
;OSCCONL (low byte) unlock sequence
MOV        #OSCCONL, w1
MOV        #0x46, w2
MOV        #0x57, w3
MOV.b      w2, [w1]
MOV.b      w3, [w1]
;Start oscillator switch operation
BSET       OSCCON,#0
```

**EXAMPLE 9-2: BASIC 'C' CODE SEQUENCE FOR CLOCK SWITCHING**

```
//Use compiler built-in function to write
new clock setting
__builtin_write_OSCCONH(0x01); //0x01
switches to FRCPLL

//Use compiler built-in function to set the
OSWEN bit.
__builtin_write_OSCCONL(OSCCONL | 0x01);

//Optional: Wait for clock switch sequence
to complete
while(OSCCONbits.OSWEN == 1);
```

## 9.5 Reference Clock Output

In addition to the CLKO output ($F_{OSC}/2$) available in certain oscillator modes, the device clock in the PIC24FXXXXX family devices can also be configured to provide a reference clock output signal to a port pin. This feature is available in all oscillator configurations and allows the user to select a greater range of clock submultiples to drive external devices in the application.

This reference clock output is controlled by the REFOCON register (Register 9-4). Setting the ROEN bit (REFOCON<15>) makes the clock signal available on the REFO pin. The RODIV<3:0> bits (REFOCON<11:8>) enable the selection of 16 different clock divider options.

The ROSSLP and ROSEL bits (REFOCON<13:12>) control the availability of the reference output during Sleep mode. The ROSEL bit determines if the oscillator on OSC1 and OSC2, or the current system clock source, is used for the reference clock output. The ROSSLP bit determines if the reference source is available on REFO when the device is in Sleep mode.

To use the reference clock output in Sleep mode, both the ROSSLP and ROSEL bits must be set. The device clock must also be configured for one of the primary modes (EC, HS or XT); otherwise, if the ROSEL bit is not also set, the oscillator on OSC1 and OSC2 will be powered down when the device enters Sleep mode. Clearing the ROSEL bit allows the reference output frequency to change as the system clock changes during any clock switches.

## REGISTER 9-4: REFOCON: REFERENCE OSCILLATOR CONTROL REGISTER

| R/W-0 | U-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

| Legend: | | |
|---------|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared      x = Bit is unknown |

bit 15      **ROEN:** Reference Oscillator Output Enable bit

1 = Reference Oscillator is enabled on the REFO pin
0 = Reference Oscillator is disabled

bit 14      **Unimplemented:** Read as '0'

bit 13      **ROSSLP:** Reference Oscillator Output Stop in Sleep bit

1 = Reference Oscillator continues to run in Sleep
0 = Reference Oscillator is disabled in Sleep

bit 12      **ROSEL:** Reference Oscillator Source Select bit

1 = Primary Oscillator is used as the base clock[1]
0 = System clock is used as the base clock; base clock reflects any clock switching of the device

bit 11-8     **RODIV<3:0>:** Reference Oscillator Divisor Select bits

1111 = Base clock value divided by 32,768
1110 = Base clock value divided by 16,384
1101 = Base clock value divided by 8,192
1100 = Base clock value divided by 4,096
1011 = Base clock value divided by 2,048
1010 = Base clock value divided by 1,024
1001 = Base clock value divided by 512
1000 = Base clock value divided by 256
0111 = Base clock value divided by 128
0110 = Base clock value divided by 64
0101 = Base clock value divided by 32
0100 = Base clock value divided by 16
0011 = Base clock value divided by 8
0010 = Base clock value divided by 4
0001 = Base clock value divided by 2
0000 = Base clock value

bit 7-0      **Unimplemented:** Read as '0'

**Note 1:** The crystal oscillator must be enabled using the FOSC<2:0> bits; the crystal maintains the operation in Sleep mode.

**NOTES:**

## 10.0   POWER-SAVING FEATURES

> **Note:**   This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"PIC24F Family Reference Manual"*, **"Power-Saving Features with VBAT"** (DS30622).
>
> This FRM describes some features which are not implemented in this device. Sections related to the VBAT pin and Deep Sleep do not apply to the PIC24FV16KM204 family.

The PIC24FV16KM204 family of devices provides the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of circuits being clocked constitutes lower consumed power. All PIC24F devices manage power consumption in four different ways:

• Clock Frequency
• Instruction-Based Sleep and Idle modes
• Software Controlled Doze mode
• Selective Peripheral Control in Software

Combinations of these methods can be used to selectively tailor an application's power consumption, while still maintaining critical application features, such as timing-sensitive communications.

### 10.1   Clock Frequency and Clock Switching

PIC24F devices allow for a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSCx bits. The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in **Section 9.0 "Oscillator Configuration"**.

### 10.2   Instruction-Based Power-Saving Modes

PIC24F devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution; Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation.

The 'C' syntax of the PWRSAV instruction is shown in Example 10-1.

> **Note:**   SLEEP_MODE and IDLE_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to "wake-up".

#### 10.2.1   SLEEP MODE

Sleep mode includes these features:

• The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
• The device current consumption will be reduced to a minimum provided that no I/O pin is sourcing current.
• The I/O pin directions and states are frozen.
• The Fail-Safe Clock Monitor does not operate during Sleep mode since the system clock source is disabled.
• The LPRC clock will continue to run in Sleep mode if the WDT or RTCC with LPRC as the clock source is enabled.
• The WDT, if enabled, is automatically cleared prior to entering Sleep mode.
• Some device features or peripherals may continue to operate in Sleep mode. This includes items, such as the Input Change Notification on the I/O ports or peripherals that use an External Clock input. Any peripheral that requires the system clock source for its operation will be disabled in Sleep mode.

The device will wake-up from Sleep mode on any of these events:

• On any interrupt source that is individually enabled
• On any form of device Reset
• On a WDT time-out

On wake-up from Sleep, the processor will restart with the same clock source that was active when Sleep mode was entered.

**EXAMPLE 10-1:**   **'C' POWER-SAVING ENTRY**

```
Sleep();              //Put the device into Sleep mode
Idle();               //Put the device into Idle mode
```

---

### 10.2.2 IDLE MODE

Idle mode includes these features:

- The CPU will stop executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see **Section 10.6 "Selective Peripheral Module Control"**).
- If the WDT or FSCM is enabled, the LPRC will also remain active.

The device will wake from Idle mode on any of these events:

- Any interrupt that is individually enabled
- Any device Reset
- A WDT time-out

On wake-up from Idle, the clock is reapplied to the CPU and instruction execution begins immediately, starting with the instruction following the PWRSAV instruction or the first instruction in the ISR.

### 10.2.3 INTERRUPTS COINCIDENT WITH POWER SAVE INSTRUCTIONS

Any interrupt that coincides with the execution of a PWRSAV instruction will be held off until entry into Sleep or Idle mode has completed. The device will then wake-up from Sleep or Idle mode.

#### 10.2.3.1 Power-on Resets (PORs)

V$_{DD}$ voltage is monitored to produce PORs. When a true POR occurs, the entire device is reset.

## 10.3 Ultra Low-Power Wake-up

The Ultra Low-Power Wake-up (ULPWU) on pin, RB0, allows a slow falling voltage to generate an interrupt without excess current consumption.

To use this feature:

1. Charge the capacitor on RB0 by configuring the RB0 pin to an output and setting it to '1'.
2. Stop charging the capacitor by configuring RB0 as an input.
3. Discharge the capacitor by setting the ULPEN and ULPSINK bits in the ULPWCON register.
4. Configure Sleep mode.
5. Enter Sleep mode.

When the voltage on RB0 drops below V$_{IL}$, the device wakes up and executes the next instruction.

This feature provides a low-power technique for periodically waking up the device from Sleep mode.

The time-out is dependent on the discharge time of the RC circuit on RB0.

When the ULPWU module wakes the device from Sleep mode, the ULPWUIF bit (IFS5<0>) is set. Software can check this bit upon wake-up to determine the wake-up source.

See Example 10-2 for initializing the ULPWU module.

### EXAMPLE 10-2: ULTRA LOW-POWER WAKE-UP INITIALIZATION

```
//*****************************
// 1. Charge the capacitor on RB0
//*****************************
    TRISBbits.TRISB0 = 0;
    LATBbits.LATB0 = 1;
    for(i = 0; i < 10000; i++) Nop();
//*****************************
//2. Stop Charging the capacitor
//   on RB0
//*****************************
    TRISBbits.TRISB0 = 1;
//*****************************
//3. Enable ULPWU Interrupt
//*****************************
IFS5bits.ULPWUIF = 0;
IEC5bits.ULPWUIE = 1;
IPC21bits.ULPWUIP = 0x7;
//*****************************
//4. Enable the Ultra Low Power
//   Wakeup module and allow
//   capacitor discharge
//*****************************
    ULPWCONbits.ULPEN = 1;
    ULPWCONbit.ULPSINK = 1;
//*****************************
//5. Enter Sleep Mode
//*****************************
    Sleep();
//for sleep, execution will
//resume here
```

A series resistor, between RB0 and the external capacitor provides overcurrent protection for the AN2/ULPWU/RB0 pin and enables software calibration of the time-out (see Figure 10-1).

### FIGURE 10-1: SERIES RESISTOR

A timer can be used to measure the charge time and discharge time of the capacitor. The charge time can then be adjusted to provide the desired delay in Sleep. This technique compensates for the affects of temperature, voltage and component accuracy. The peripheral can also be configured as a simple, programmable Low-Voltage Detect (LVD) or temperature sensor.

---

## 10.4 Voltage Regulator-Based Power-Saving Features

The PIC24FV16KM204 family series devices have a voltage regulator that has the ability to alter functionality to provide power savings. The on-chip regulator is made up of two basic modules: the Voltage Regulator (VREG) and the Retention Regulator (RETREG). With the combination of VREG and RETREG, the following power modes are available:

### 10.4.1 RUN MODE

In Run mode, the main VREG is providing a regulated voltage with enough current to supply a device running at full speed and the device is not in Sleep mode. The RETREG may or may not be running, but is unused.

### 10.4.2 SLEEP MODE

In Sleep mode, the device is in Sleep and the main VREG is providing a regulated voltage to the core. By default, in Sleep mode, the regulator enters a low-power standby state which consumes reduced quiescent current. The PMSLP bit (RCON<8>) controls the regulator state in Sleep mode. If the PMSLP bit is set, the program Flash memory will stay powered on during Sleep mode and the regulator will stay in its full-power mode.

### 10.4.3 RETENTION REGULATOR

The Retention Regulator, sometimes referred to as the low-voltage regulator, is designed to provide power to the core at a lower voltage than the standard voltage regulator, while consuming significantly lower quiescent current. Refer to **Section 27.0 "Electrical Characteristics"** for the voltage output range of the RETREG. This regulator is only used in Sleep mode, and has limited output current to maintain the RAM and provide power for limited peripherals, such as the WDT, while the device is in Sleep. It is controlled by the RETCFG Configuration bit (FPOR<2>) and in firmware by the RETEN bit (RCON<12>). RETCFG must be programmed (= 0) and the RETEN bit must be set (= 1) for the Retention Regulator to be enabled.

### 10.4.4 RETENTION SLEEP MODE

In Retention Sleep mode, the device is in Sleep and all regulated voltage is provided solely by the RETREG, while the main VREG is disabled. Consequently, this mode provides the lowest Sleep power consumption, but has a trade-off of a longer wake-up time. The low-voltage Sleep wake-up time is longer than Sleep mode due to the extra time required to re-enable the VREG and raise the V$_{DDCORE}$ supply rail back to normal regulated levels.

| Note: | The PIC24F16KM204 family devices do not have any internal voltage regulation, and therefore, do not support Retention Sleep mode. |
|---|---|

**TABLE 10-1: VOLTAGE REGULATION CONFIGURATION SETTINGS FOR PIC24FXXXXX FAMILY DEVICES**

| RETCFG Bit (FPOR<2>) | RETEN Bit (RCON<12> | PMSLP Bit (RCON<8>) | Power Mode During Sleep | Description |
|---|---|---|---|---|
| 0 | 0 | 1 | Sleep | VREG mode (normal) is unchanged during Sleep. RETREG is unused. |
| 0 | 0 | 0 | Sleep (Standby) | VREG goes to Low-Power Standby mode during Sleep. RETREG is unused. |
| 0 | 1 | 0 | Retention Sleep | VREG is off during Sleep. RETREG is enabled and provides Sleep voltage regulation. |
| 1 | x | 1 | Sleep | VREG mode (normal) is unchanged during Sleep. RETREG is disabled at all times. |
| 1 | x | 0 | Sleep (Standby) | VREG goes to Low-Power Standby mode during Sleep. RETREG is disabled at all times. |

## 10.5 Doze Mode

Generally, changing clock speed and invoking one of the power-saving modes are the preferred strategies for reducing power consumption. There may be circumstances, however, where this is not practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed may introduce communication errors, while using a power-saving mode may stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (CLKDIV<11>). The ratio between peripheral and core clock speed is determined by the DOZE<2:0> bits (CLKDIV<14:12>). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default.

It is also possible to use Doze mode to selectively reduce power consumption in event driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption. Meanwhile, the CPU Idles, waiting for something to invoke an interrupt routine. Enabling the automatic return to full-speed CPU operation on interrupts is enabled by setting the ROI bit (CLKDIV<15>). By default, interrupt events have no effect on Doze mode operation.

## 10.6 Selective Peripheral Module Control

Idle and Doze modes allow users to substantially reduce power consumption by slowing or stopping the CPU clock. Even so, peripheral modules still remain clocked, and thus, consume power. There may be cases where the application needs what these modes do not provide: the allocation of power resources to CPU processing with minimal power consumption from the peripherals.

PIC24F devices address this requirement by allowing peripheral modules to be selectively disabled, reducing or eliminating their power consumption. This can be done with two control bits:

- The Peripheral Enable bit, generically named, "XXXEN", located in the module's main control SFR.
- The Peripheral Module Disable (PMD) bit, generically named, "XXXMD", located in one of the PMDx Control registers.

Both bits have similar functions in enabling or disabling its associated module. Setting the PMDx bits for a module, disables all clock sources to that module, reducing its power consumption to an absolute minimum. In this state, the control and status registers associated with the peripheral will also be disabled, so writes to those registers will have no effect, and read values will be invalid. Many peripheral modules have a corresponding PMDx bit.

In contrast, disabling a module by clearing its XXXEN bit, disables its functionality, but leaves its registers available to be read and written to. Power consumption is reduced, but not by as much as when the PMDx bits are used. Most peripheral modules have an enable bit; exceptions include capture, compare and RTCC.

To achieve more selective power savings, peripheral modules can also be selectively disabled when the device enters Idle mode. This is done through the control bit of the generic name format, "XXXIDL". By default, all modules that can operate during Idle mode will do so. Using the disable on Idle feature disables the module while in Idle mode, allowing further reduction of power consumption during Idle mode, enhancing power savings for extremely critical power applications.

**NOTES:**

## 11.0    I/O PORTS

> **Note:**  This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the I/O ports, refer to the *"PIC24F Family Reference Manual"*, **"I/O Ports with Peripheral Pin Select (PPS)"** (DS39711). Note that the PIC24FV16KM204 family devices do not support Peripheral Pin Select features.

All of the device pins (except VDD and VSS) are shared between the peripherals and the parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity.

### 11.1    Parallel I/O (PIO) Ports

A Parallel I/O port that shares a pin with a peripheral is, in general, subservient to the peripheral. The peripheral's output buffer data and control signals are provided to a pair of multiplexers. The multiplexers select whether the peripheral or the associated port has ownership of the output data and control signals of the I/O pin. The logic also prevents "loop through", in which a port's digital output can drive the input of a peripheral that shares the same pin. Figure 11-1 illustrates how ports are shared with other peripherals and the associated I/O pin to which they are connected.

When a peripheral is enabled and the peripheral is actively driving an associated pin, the use of the pin as a general purpose output pin is disabled. The I/O pin may be read, but the output driver for the parallel port bit will be disabled. If a peripheral is enabled, but the peripheral is not actively driving a pin, that pin may be driven by a port.

All port pins have three registers directly associated with their operation as digital I/O. The Data Direction register (TRISx) determines whether the pin is an input or an output. If the Data Direction register bit is a '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the Data Latch register (LATx), read the latch. Writes to the latch, write the latch. Reads from the port (PORTx), read the port pins; writes to the port pins, write the latch.

Any bit and its associated data and control registers that are not valid for a particular device will be disabled. That means the corresponding LATx and TRISx registers, and the port pin will read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs.

**FIGURE 11-1:       BLOCK DIAGRAM OF A TYPICAL SHARED PORT STRUCTURE**

---
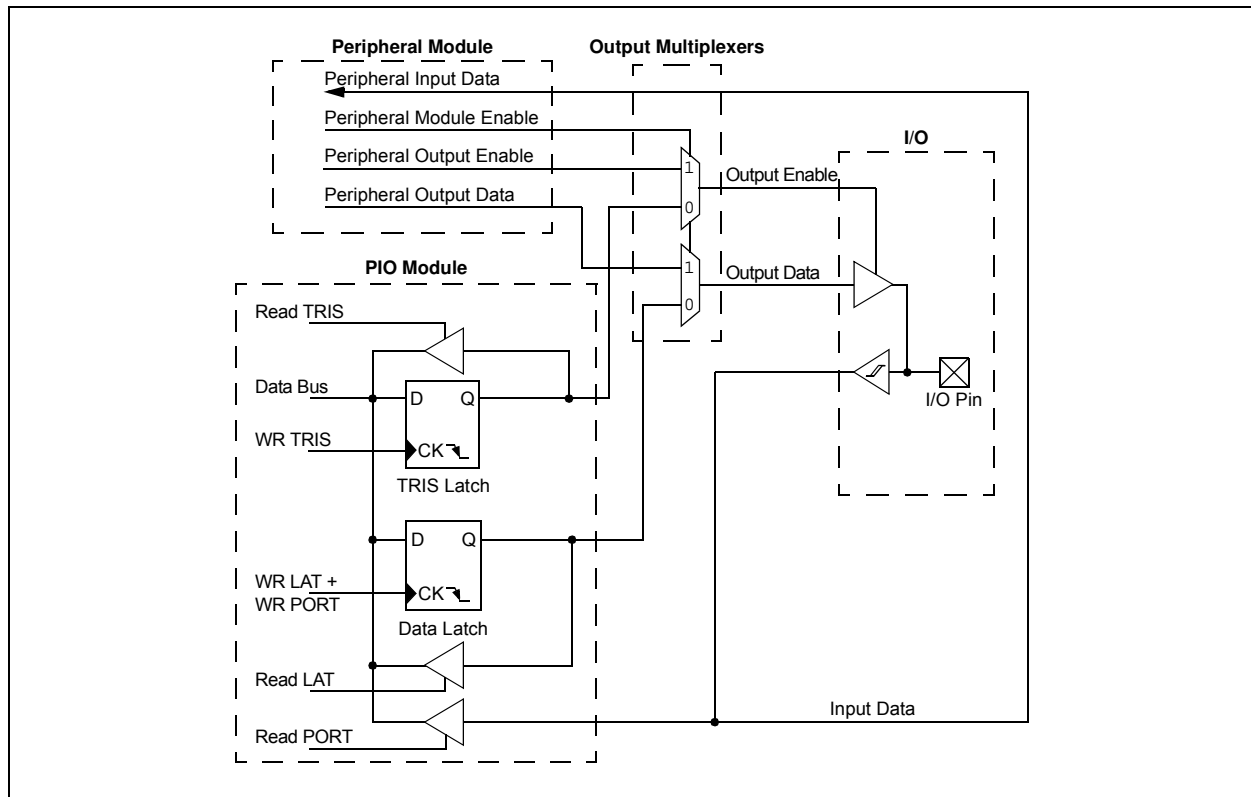

## 11.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORT, LAT and TRIS registers for data control, each port pin can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The maximum open-drain voltage allowed is the same as the maximum $V_{IH}$ specification.

## 11.2 Configuring Analog Port Pins

The use of the ANSx and TRISx registers controls the operation of the A/D port pins. The port pins that are desired as analog inputs must have their corresponding TRISx bit set (input). If the TRISx bit is cleared (output), the digital output level ($V_{OH}$ or $V_{OL}$) will be converted.

When reading the PORTx register, all pins configured as analog input channels will read as cleared (a low level). Analog levels on any pin that is defined as a digital input (including the ANx pins) may cause the input buffer to consume current that exceeds the device specifications.

## 11.2.1 ANALOG SELECTION REGISTER

I/O pins with shared analog functionality, such as A/D inputs and comparator inputs, must have their digital inputs shut off when analog functionality is used. Note that analog functionality includes an analog voltage being applied to the pin externally.

To allow for analog control, the ANSx registers are provided. There is one ANSx register for each port (ANSA, ANSB and ANSC). Within each ANSx register, there is a bit for each pin that shares analog functionality with the digital I/O functionality.

If a particular pin does not have an analog function, that bit is unimplemented. See Register 11-1 to Register 11-3 for implementation.

| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared          x = Bit is unknown |

bit 15-3    **Unimplemented:** Read as '0'

bit 2-0    **ANSC<2:0>:** Analog Select Control bits[1,2]
      1 = Digital input buffer is not active (use for analog input)
      0 = Digital input buffer is active

**Note 1:** These bits are not implemented in 20-pin devices.
    **2:** These bits are not implemented in 28-pin devices.

### 11.2.2 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation, and a read operation of the same port. Typically, this instruction would be a NOP.

## 11.3 Input Change Notification (ICN)

The Input Change Notification function of the I/O ports allows the PIC24FXXXXX family of devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on selected input pins. This feature is capable of detecting input Change-of-States, even in Sleep mode, when the clocks are disabled. Depending on the device pin count, there are up to 37 external signals (CN0 through CN36) that may be selected (enabled) for generating an interrupt request on a Change-of-State.

There are six control registers associated with the CN module. The CNEN1 and CNEN3 registers contain the interrupt enable control bits for each of the CNx input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

Each CNx pin also has a weak pull-up/pull-down connected to it. The pull-ups act as a current source that is connected to the pin. The pull-downs act as a current sink to eliminate the need for external resistors when push button or keypad devices are connected.

On any pin, only the pull-up resistor or the pull-down resistor should be enabled, but not both of them. If the push button or the keypad is connected to VDD, enable the pull-down, or if they are connected to VSS, enable the pull-up resistors. The pull-ups are enabled separately using the CNPU1 and CNPU3 registers, which contain the control bits for each of the CNx pins.

Setting any of the control bits enables the weak pull-ups for the corresponding pins. The pull-downs are enabled separately using the CNPD1 and CNPD3 registers, which contain the control bits for each of the CNx pins. Setting any of the control bits enables the weak pull-downs for the corresponding pins.

When the internal pull-up is selected, the pin uses VDD as the pull-up source voltage. When the internal pull-down is selected, the pins are pulled down to VSS by an internal resistor. Make sure that there is no external pull-up source/pull-down sink when the internal pull-ups/pull-downs are enabled.

| Note: | Pull-ups and pull-downs on Change Notification (CN) pins should always be disabled whenever the port pin is configured as a digital output. |
| --- | --- |

### EXAMPLE 11-1: PORT WRITE/READ EXAMPLE

```
MOV    0xFF00, W0;          //Configure PORTB<15:8> as inputs and PORTB<7:0> as outputs
MOV    W0, TRISB;
NOP;                        //Delay 1 cycle
BTSS   PORTB, #13;          //Next Instruction

Equivalent 'C' Code
TRISB = 0xFF00;             //Configure PORTB<15:8> as inputs and PORTB<7:0> as outputs
NOP();                      //Delay 1 cycle
if(PORTBbits.RB13 == 1)     // execute following code if PORTB pin 13 is set.
{
}
```

## 12.0 TIMER1

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on timers, refer to the *"PIC24F Family Reference Manual"*, **"Timers"** (DS39704).

The Timer1 module is a 16-bit timer which can serve as the time counter for the Real-Time Clock (RTC) or operate as a free-running, interval timer/counter. Timer1 can operate in three modes:

- 16-Bit Timer
- 16-Bit Synchronous Counter
- 16-Bit Asynchronous Counter

Timer1 also supports these features:

- Timer Gate Operation
- Selectable Prescaler Settings
- Timer Operation During CPU Idle and Sleep modes
- Interrupt on 16-Bit Period Register Match or Falling Edge of External Gate Signal

Figure 12-1 illustrates a block diagram of the 16-bit Timer1 module.

To configure Timer1 for operation:

1. Set the TON bit (= 1).
2. Select the timer prescaler ratio using the TCKPS<1:0> bits.
3. Set the Clock and Gating modes using the TCS and TGATE bits.
4. Set or clear the TSYNC bit to configure synchronous or asynchronous operation.
5. Load the timer period value into the PR1 register.
6. If interrupts are required, set the Timer1 Interrupt Enable bit, T1IE. Use the Timer1 Interrupt Priority bits, T1IP<2:0>, to set the interrupt priority.

**FIGURE 12-1: 16-BIT TIMER1 MODULE BLOCK DIAGRAM**
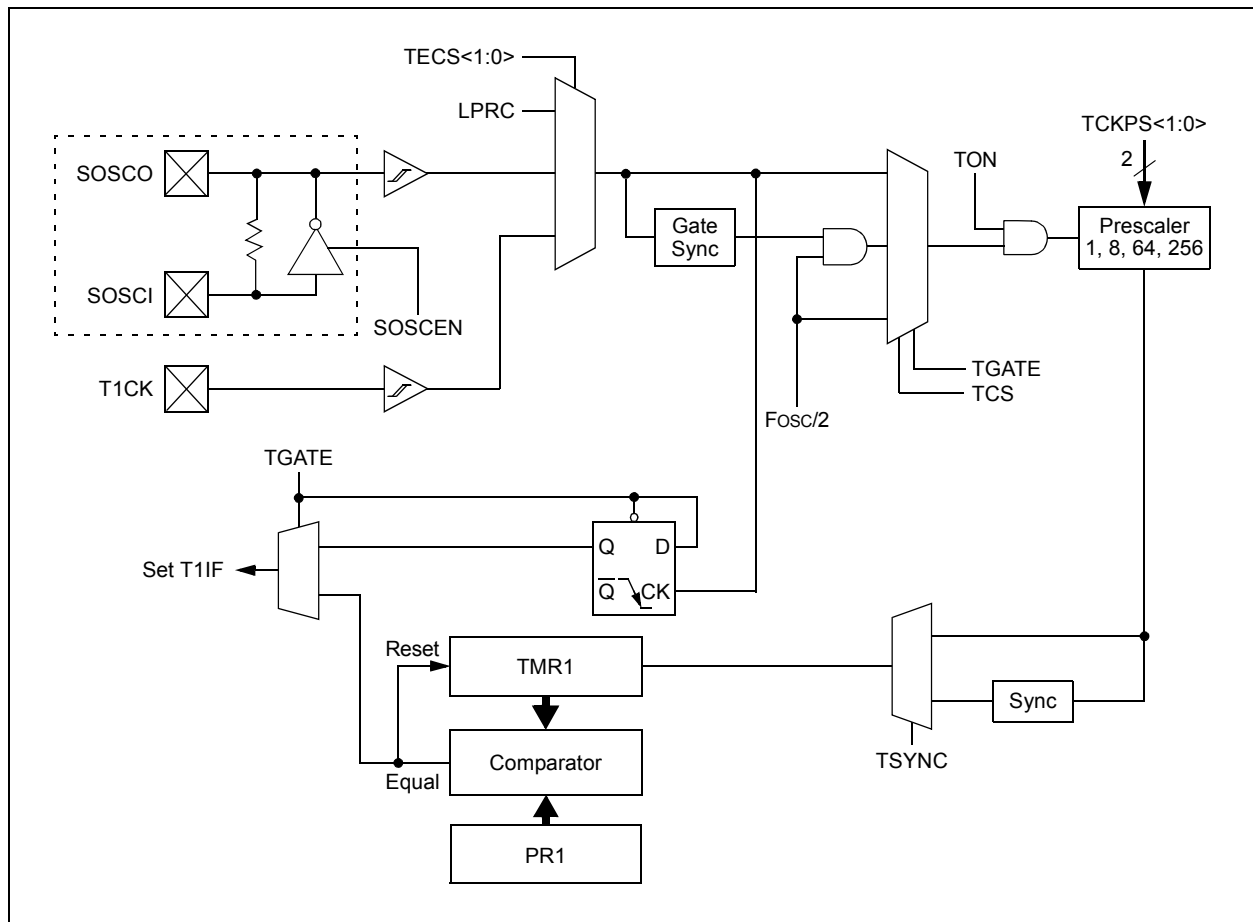

## REGISTER 12-1:    T1CON: TIMER1 CONTROL REGISTER

## 13.0 CAPTURE/COMPARE/PWM/ TIMER MODULES (MCCP AND SCCP)

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the MCCP/SCCP modules, refer to the *"PIC24F Family Reference Manual"*.

PIC24FV16KM204 family devices include several Capture/Compare/PWM/Timer base modules, which provide the functionality of three different peripherals of earlier PIC24F devices. The module can operate in one of three major modes:

- General Purpose Timer
- Input Capture
- Output Compare/PWM

The module is provided in two different forms, distinguished by the number of PWM outputs that the module can generate. Single output modules (SCCPs) provide only one PWM output. Multiple output modules (MCCPs) can provide up to six outputs and an extended range of power control features, depending on the pin count of the particular device. All other features of the modules are identical.

The SCCP and MCCP modules can be operated only in one of the three major modes at any time. The other modes are not available unless the module is reconfigured for the new mode.

A conceptual block diagram for the module is shown in Figure 13-1. All three modes share a time base generator and a common Timer register pair (CCPxTMRH/L); other shared hardware components are added as a particular mode requires.

Each module has a total of seven control and status registers:

- CCPxCON1L (Register 13-1)
- CCPxCON1H (Register 13-2)
- CCPxCON2L (Register 13-3)
- CCPxCON2H (Register 13-4)
- CCPxCON3L (Register 13-5)
- CCPxCON3H (Register 13-6)
- CCPxSTATL (Register 13-7)

Each module also includes eight buffer/counter registers that serve as Timer Value registers or data holding buffers:

- CCPxTMRH/CCPxTMRL (Timer High/Low Counters)
- CCPxPRH/CCPxPRL (Timer Period High/Low)
- CCPxRA (Primary Output Compare Data Buffer)
- CCPxRB (Secondary Output Compare Data Buffer)
- CCPxBUFH/CCPxBUFL (Input Capture High/Low Buffers)

**FIGURE 13-1:     MCCPx/SCCPx CONCEPTUAL BLOCK DIAGRAM**
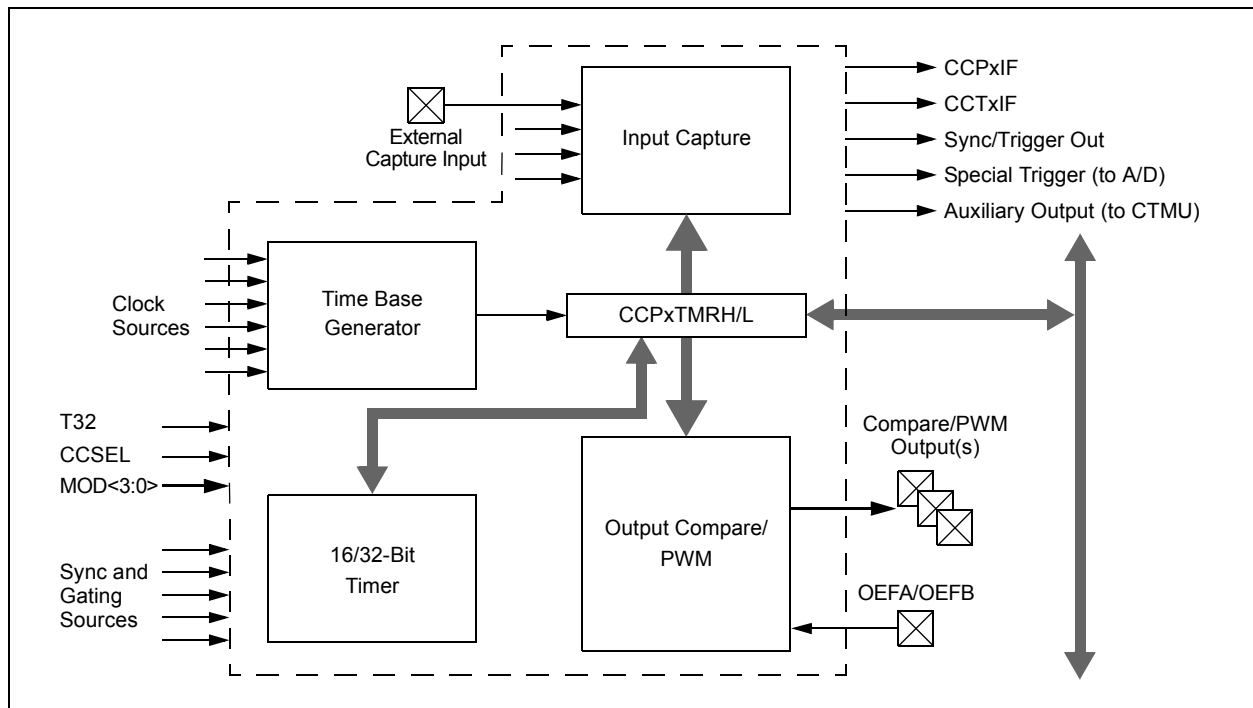

## 13.1 Time Base Generator

The Timer Clock Generator (TCG) generates a clock for the module's internal time base, using one of the clock signals already available on the microcontroller. This is used as the time reference for the module in its three major modes. The internal time base is shown in Figure 13-2.

There are eight inputs available to the clock generator, which are selected using the CLKSEL<2:0> bits (CCPxCON1L<10:8>). Available sources include the FRC and LPRC, the Secondary Oscillator, and the TCLKI External Clock inputs. The system clock is the default source (CLKSEL<2:0> = 000). On PIC24FV16KM204 family devices, clock sources to the MCCPx module must be synchronized with the system clock; as a result, when clock sources are selected, clock input timing restrictions or module operating restrictions may exist. Table 13-1 describes which time base sources are valid for the various operating modes.

**TABLE 13-1: VALID TIMER OPTIONS FOR MCCPx/SCCPx MODES**

| CLKSEL <2:0>[1] | Timer | | Input Capture | Output Compare |
|---|---|---|---|---|
| | Sync[2] | Async[3] | | |
| 111 | X | — | — | — |
| 110 | X | — | — | — |
| 101 | X | — | — | — |
| 011 | X | — | — | — |
| 010 | X | — | — | — |
| 001 | X | — | — | — |
| 000[4] | — | X | X | X |

**Note 1:** See Register 13-1 for the description of the time base sources.

**2:** Synchronous Operation: TMRSYNC (CCPxCON1L<11>) = 1 and TRIGEN (CCPxCON1H<7>) = 0.

**3:** Asynchronous Operation: (TMRSYNC = 0) or Triggered mode (TRIGEN = 1).

**4:** When CLKSEL<2:0> = 000, the TMRSYNC bit must be cleared.

**FIGURE 13-2: TIMER CLOCK GENERATOR**

Note 1: Gating available in Timer modes only.
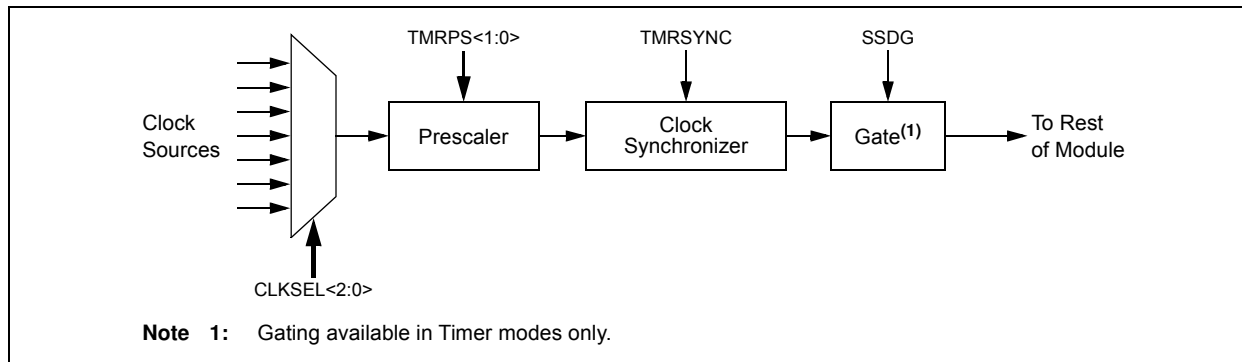

## 13.2 General Purpose Timer

Timer mode is selected when CCSEL = 0 and MOD<3:0> = 0000. The timer can function as a 32-bit timer or a dual 16-bit timer, depending on the setting of the T32 bit (Table 13-2).

### TABLE 13-2: TIMER OPERATION MODE

| T32<br>(CCPxCON1L<5>) | Operating Mode |
| --- | --- |
| 0 | Dual Timer Mode (16-bit) |
| 1 | Timer Mode (32-bit) |

Dual 16-Bit Timer mode provides a simple timer function with two independent 16-bit timer/counters. The primary timer uses CCPxTMRL and CCPxPRL. Only the primary timer can interact with other modules on the device. It generates the MCCPx Sync out signals for use by other MCCP modules. It can also use the SYNC<4:0> bits signal generated by other modules.

The secondary timer uses CCPxTMRH and CCPxPRH. It is intended to be used only as a periodic interrupt source for scheduling CPU events. It does not generate an Output Sync/Trigger signal like the primary time base. In Dual Timer mode, the Secondary Timer Period register, CCPxPRH, generates the MCCP Compare Event (CCPxIF) used by many other modules on the device.

The 32-Bit Timer mode uses the CCPxTMRL and CCPxTMRH registers, together, as a single 32-bit timer. When CCPxTMRL overflows, CCPxTMRH increments by one. This mode provides a simple timer function when it is important to track long time periods. Note that the T32 bit (CCPxCON1L<5>) should be set before the CCPxTMRL or CCPxPRH registers are written to initialize the 32-bit timer.

### 13.2.1 SYNC AND TRIGGER OPERATION

In both 16-bit and 32-bit modes, the timer can also function in either Synchronization ("Sync") or Trigger operation. Both use the SYNC<4:0> bits (CCPxCON1H<4:0>) to determine the input signal source. The difference is how that signal affects the timer.

In Sync operation, the timer Reset or clear occurs when the input selected by SYNC<4:0> is asserted. The timer immediately begins to count again from zero unless it is held for some other reason. Sync operation is used whenever the TRIGEN bit (CCPxCON1H<7>) is cleared. SYNC<4:0> can have any value except '11111'.

In Trigger operation, the timer is held in Reset until the input selected by SYNC<4:0> is asserted; when it occurs, the timer starts counting. Trigger operation is used whenever the TRIGEN bit is set. In Trigger mode, the timer will continue running after a Trigger event as long as the CCPTRIG bit (CCPxSTATL< 7>) is set. To clear CCPTRIG, the TRCLR bit (CCPxSTATL<5>) must be set to clear the Trigger event, reset the timer and hold it at zero until another Trigger event occurs. On PIC24FV16KM204 family devices, Trigger operation can only be used when the system clock is the time base source (CLKSEL<2:0> = 000).

### FIGURE 13-3: DUAL 16-BIT TIMER MODE
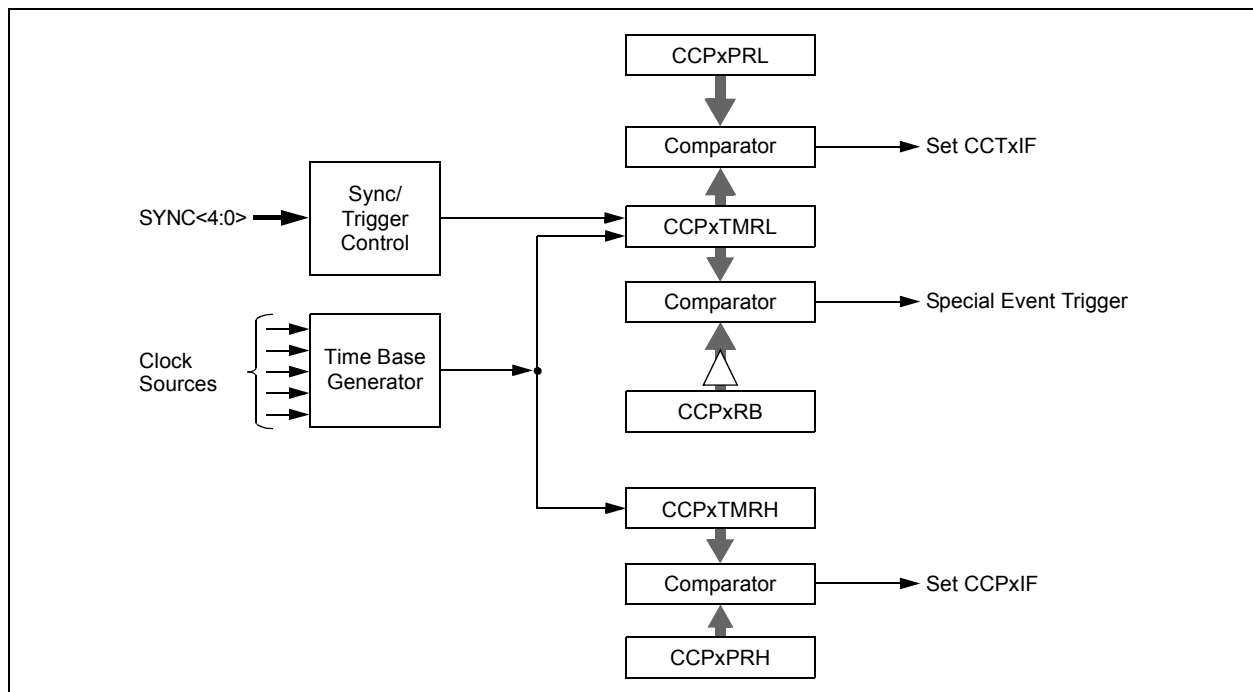

**FIGURE 13-4:** **32-BIT TIMER MODE**
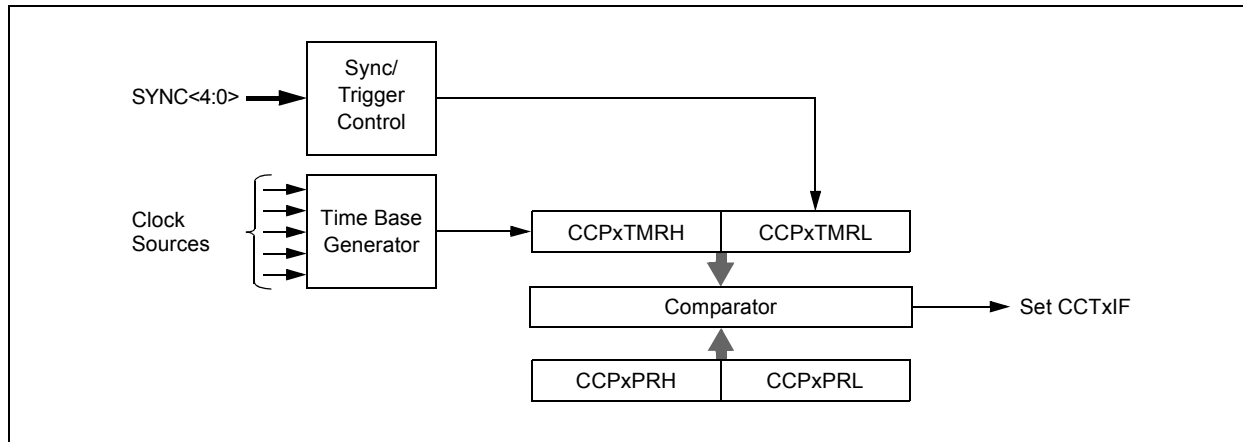

## 13.3 Output Compare Mode

Output Compare mode compares the Timer register value with the value of one or two Compare registers, depending on its mode of operation. The Output Compare x module on compare match events has the ability to generate a single output transition or a train of output pulses. Like most PIC® MCU peripherals, the Output Compare x module can also generate interrupts on a compare match event.

Table 13-3 shows the various modes available in Output Compare modes.

**TABLE 13-3: OUTPUT COMPARE/PWM MODES**

| MOD<3:0><br>(CCPxCON1L<3:0>) | T32<br>(CCPxCON1L<5>) | Operating Mode | |
|---|---|---|---|
| 0001 | 0 | Output High on Compare (16-bit) | Single Edge Mode |
| 0001 | 1 | Output High on Compare (32-bit) | |
| 0010 | 0 | Output Low on Compare (16-bit) | |
| 0010 | 1 | Output Low on Compare (32-bit) | |
| 0011 | 0 | Output Toggle on Compare (16-bit) | |
| 0011 | 1 | Output Toggle on Compare (32-bit) | |
| 0100 | 0 | Dual Edge Compare (16-bit) | Dual Edge Mode |
| 0101 | 0 | Dual Edge Compare (16-bit buffered) | PWM Mode |
| 0110 | 0 | Center-Aligned Pulse (16-bit buffered) | Center PWM |
| 0111 | 0 | Variable Frequency Pulse (16-bit) | |
| 0111 | 1 | Variable Frequency Pulse (32-bit) | |

**FIGURE 13-5: OUTPUT COMPARE x BLOCK DIAGRAM**
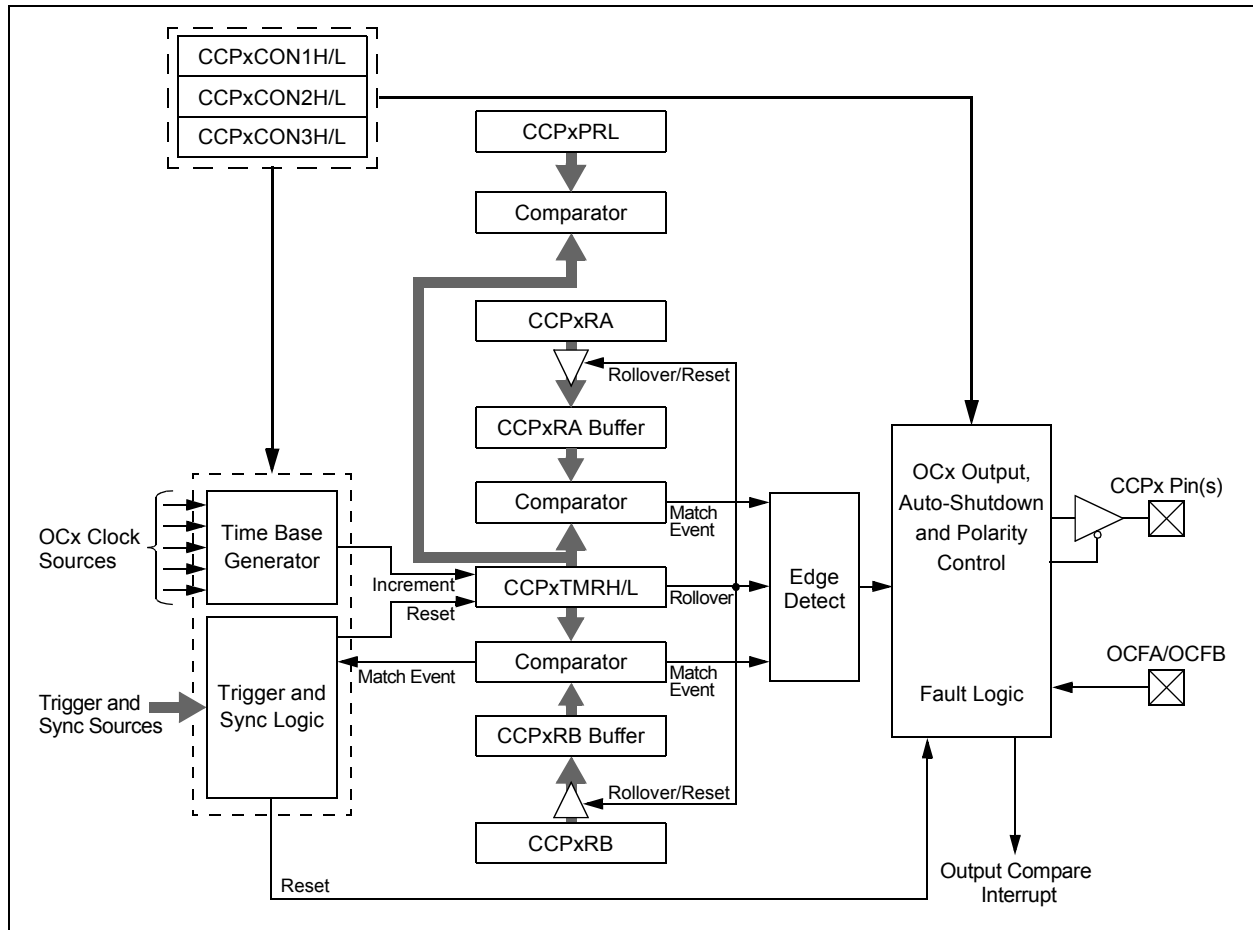

## 13.4 Input Capture Mode

Input Capture mode is used to capture a timer value from an independent timer base upon an event on an input pin or other internal Trigger source. The input capture features are useful in applications requiring frequency (time period) and pulse measurement. Figure 13-6 depicts a simplified block diagram of Input Capture mode.

Input Capture mode uses a dedicated 16/32-bit, synchronous, up counting timer for the capture function. The timer value is written to the FIFO when a capture event occurs. The internal value may be read (with a synchronization delay) using the CCPxTMRH/L register.

To use Input Capture mode, the CCSEL bit (CCPxCON1L<4>) must be set. The T32 and the MOD<3:0> bits are used to select the proper Capture mode, as shown in Table 13-4.

TABLE 13-4:    INPUT CAPTURE MODES

| MOD<3:0> (CCPxCON1L<3:0>) | T32 (CCPxCON1L<5>) | Operating Mode |
|---|---|---|
| 0000 | 0 | Edge Detect (16-bit capture) |
| 0000 | 1 | Edge Detect (32-bit capture) |
| 0001 | 0 | Every Rising (16-bit capture) |
| 0001 | 1 | Every Rising (32-bit capture) |
| 0010 | 0 | Every Falling (16-bit capture) |
| 0010 | 1 | Every Falling (32-bit capture) |
| 0011 | 0 | Every Rise/Fall (16-bit capture) |
| 0011 | 1 | Every Rise/Fall (32-bit capture) |
| 0100 | 0 | Every 4th Rising (16-bit capture) |
| 0100 | 1 | Every 4th Rising (32-bit capture) |
| 0101 | 0 | Every 16th Rising (16-bit capture) |
| 0101 | 1 | Every 16th Rising (32-bit capture) |

FIGURE 13-6:    INPUT CAPTURE x BLOCK DIAGRAM
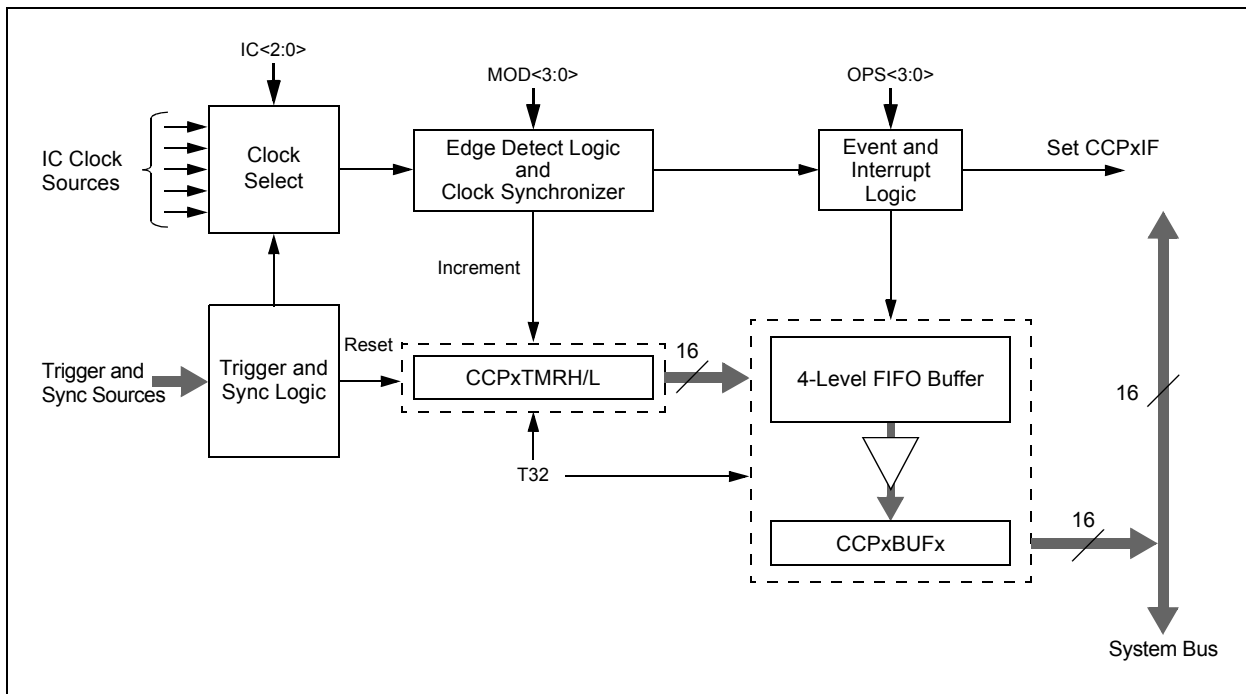

## 13.5 Auxiliary Output

The MCCPx and SCCPx modules have an auxiliary (secondary) output that provides other peripherals access to internal module signals. The auxiliary output is intended to connect to other MCCP or SCCP modules, or other digital peripherals, to provide these types of functions:

• Time Base Synchronization
• Peripheral Trigger and Clock Inputs
• Signal Gating

The type of output signal is selected using the AUXOUT<1:0> control bits (CCPxCON2H<4:3>). The type of output signal is also dependent on the module operating mode.

On the PIC24FV16KM204 family of devices, only the CTMU discharge trigger has access to the auxiliary output signal.

### TABLE 13-5: AUXILIARY OUTPUT

| AUXOUT<1:0> | CCSEL | MOD<3:0> | Comments | Signal Description |
|---|---|---|---|---|
| 00 | x | xxxx | Auxiliary output disabled | No Output |
| 01 | 0 | 0000 | Time Base modes | Time Base Period Reset or Rollover |
| 10 | | | | Special Event Trigger Output |
| 11 | | | | No Output |
| 01 | 0 | 0001 through 1111 | Output Compare modes | Time Base Period Reset or Rollover |
| 10 | | | | Output Compare Event Signal |
| 11 | | | | Output Compare Signal |
| 01 | 1 | xxxx | Input Capture modes | Time Base Period Reset or Rollover |
| 10 | | | | Reflects the Value of the ICDIS bit |
| 11 | | | | Input Capture Event Signal |

| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 15 **CCPON:** CCPx Module Enable bit

  1 = Module is enabled with an operating mode specified by the MOD<3:0> control bits
  0 = Module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **CCPSIDL:** CCPx Stop in Idle Mode Bit

  1 = Discontinues module operation when device enters Idle mode
  0 = Continues module operation in Idle mode

bit 12 **Reserved:** Maintain as '0'

bit 11 **TMRSYNC:** Time Base Clock Synchronization bit

  1 = Asynchronous module time base clock is selected and synchronized to the internal system clocks (CLKSEL<2:0> ≠ 000)
  0 = Synchronous module time base clock is selected and does not require synchronization (CLKSEL<2:0> = 000)

bit 10-8 **CLKSEL<2:0>:** CCPx Time Base Clock Select bits[1]

  111 = External TCLKIA input
  110 = External TCLKIB input
  101 = CLC1
  100 = Reserved
  011 = LPRC (31 kHz source)
  010 = Secondary Oscillator
  001 = Reserved
  000 = System clock ($T_{CY}$)

bit 7-6 **TMRPS<1:0>:** Time Base Prescale Select bits

  11 = 1:64 Prescaler
  10 = 1:16 Prescaler
  01 = 1:4 Prescaler
  00 = 1:1 Prescaler

bit 5 **T32:** 32-Bit Time Base Select bit

  1 = Uses 32-bit time base for timer, single edge output compare or input capture function
  0 = Uses 16-bit time base for timer, single edge output compare or input capture function

bit 4 **CCSEL:** Capture/Compare Mode Select bit

  1 = Input Capture peripheral
  0 = Output Compare/PWM/Timer peripheral (exact function is selected by the MOD<3:0> bits)

**Note 1:** Clock options are limited in some operating modes. See Table 13-1 for restrictions.

**REGISTER 13-1:  CCPxCON1L: CCPx CONTROL 1 LOW REGISTERS (CONTINUED)**

bit 3-0  **MOD<3:0>:** CCPx Mode Select bits

For CCSEL = 1 (Input Capture modes):
1xxx = Reserved
011x = Reserved
0101 = Capture every 16th rising edge
0100 = Capture every 4th rising edge
0011 = Capture every rising and falling edge
0010 = Capture every falling edge
0001 = Capture every rising edge
0000 = Capture every rising and falling edge (Edge Detect mode)

For CCSEL = 0 (Output Compare/Timer modes):
1111 = External Input mode: Pulse generator is disabled, source is selected by ICS<2:0>
1110 = Reserved
110x = Reserved
10xx = Reserved
0111 = Variable Frequency Pulse mode
0110 = Center-Aligned Pulse Compare mode, buffered
0101 = Dual Edge Compare mode, buffered
0100 = Dual Edge Compare mode
0011 = 16-Bit/32-Bit Single Edge mode, toggle output on compare match
0010 = 16-Bit/32-Bit Single Edge mode, drive output low on compare match
0001 = 16-Bit/32-Bit Single Edge mode, drive output high on compare match
0000 = 16-Bit/32-Bit Timer mode, output functions are disabled

**Note  1:**  Clock options are limited in some operating modes. See Table 13-1 for restrictions.

## REGISTER 13-2: CCPxCON1H: CCPx CONTROL 1 HIGH REGISTERS

|---------|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared    x = Bit is unknown |

bit 15 **OPSSRC:** Output Postscaler Source Select bit[1]

1 = Output postscaler scales module Trigger output events
0 = Output postscaler scales time base interrupt events

bit 14 **RTRGEN:** Retrigger Enable bit[2]

1 = Time base can be retriggered when TRIGEN bit = 1
0 = Time base may not be retriggered when TRIGEN bit = 1

bit 13-12 **Unimplemented:** Read as '0'

bit 11-8 **OPS3<3:0>:** CCPx Interrupt Output Postscale Select bits[3]

1111 = Interrupt every 16th time base period match
1110 = Interrupt every 15th time base period match
**. . .**
0100 = Interrupt every 5th time base period match
0011 = Interrupt every 4th time base period match or 4th input capture event
0010 = Interrupt every 3rd time base period match or 3rd input capture event
0001 = Interrupt every 2nd time base period match or 2nd input capture event
0000 = Interrupt after each time base period match or input capture event

bit 7 **TRIGEN:** CCPx Trigger Enable bit[4]

1 = Trigger operation of time base is enabled
0 = Trigger operation of time base is disabled

bit 6 **ONESHOT:** One-Shot Mode Enable bit

1 = One-Shot Trigger mode is enabled; Trigger duration is set by OSCNT<2:0>
0 = One-Shot Trigger mode IS disabled

bit 5 **ALTSYNC:** CCPx Clock Select bits

1 = An alternate signal is used as the module synchronization output signal
0 = The module synchronization output signal is the Time Base Reset/rollover event

bit 4-0 **SYNC<4:0>:** CCPx Synchronization Source Select bits
See Table 13-6 for the definition of inputs.

**Note 1:** This control bit has no function in Input Capture modes.
　　**2:** This control bit has no function when TRIGEN = 0.
　　**3:** Output postscale settings from 1:5 to 1:16 (0100-1111) will result in a FIFO buffer overflow for Input Capture modes.
　　**4:** Clock source options are limited when Trigger operation is enabled; refer to Table 13-1.

**TABLE 13-6: SYNCHRONIZATION SOURCES**

| SYNC<4:0> | Synchronization Source |
|---|---|
| 00000 | None; Timer with Rollover on CCPxPR Match or FFFFh |
| 00001 | MCCP1 or SCCP1 Sync Output |
| 00010 | MCCP2 or SCCP2 Sync Output |
| 00011 | MCCP3 or SCCP3 Sync Output |
| 00100 | MCCP4 or SCCP4 Sync Output |
| 00101 | MCCP5 or SCCP5 Sync Output |
| 00110 to 01010 | Unused |

bit 7 **CCPTRIG:** CCPx Trigger Status bit

1 = Timer has been triggered and is running
0 = Timer has not been triggered and is held in Reset

bit 6 **TRSET:** CCPx Trigger Set Request bit

Write '1' to this location to trigger the timer when TRIGEN = 1 (location always reads as '0').

bit 5 **TRCLR:** CCPx Trigger Clear Request bit

Write '1' to this location to cancel the timer Trigger when TRIGEN = 1 (location always reads as '0').

bit 4 **ASEVT:** CCPx Auto-Shutdown Event Status/Control bit

1 = A shutdown event is in progress; CCPx outputs are in the shutdown state
0 = CCPx outputs operate normally

bit 3 **SCEVT:** Single Edge Compare Event Status bit

1 = A single edge compare event has occurred
0 = A single edge compare event has not occurred

bit 2 **ICDIS:** Input Capture x Disable bit

1 = Event on Input Capture x pin (ICx) does not generate a capture event
0 = Event on Input Capture x pin will generate a capture event

bit 1 **ICOV:** Input Capture x Buffer Overflow Status bit

1 = The Input Capture x FIFO buffer has overflowed
0 = The Input Capture x FIFO buffer has not overflowed

bit 0 **ICBNE:** Input Capture x Buffer Status bit

1 = Input Capture x buffer has data available
0 = Input Capture x buffer is empty

## 14.0 MASTER SYNCHRONOUS SERIAL PORT (MSSP)

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on MSSP, refer to the *"PIC24F Family Reference Manual"*.

The Master Synchronous Serial Port (MSSP) module is an 8-bit serial interface, useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, Shift registers, display drivers, A/D Converters, etc. The MSSP module can operate in one of two modes:

• Serial Peripheral Interface (SPI)
• Inter-Integrated Circuit (I$^2$C™)
  - Full Master mode
  - Slave mode (with general address call)

The SPI interface supports these modes in hardware:

• Master mode
• Slave mode
• Daisy-Chaining Operation in Slave mode
• Synchronized Slave Operation

The I$^2$C interface supports the following modes in hardware:

• Master mode
• Multi-Master mode
• Slave mode with 10-Bit and 7-Bit Addressing and Address Masking
• Byte NACKing
• Selectable Address and Data Hold, and Interrupt Masking

## 14.1 I/O Pin Configuration for SPI

In SPI Master mode, the MSSP module will assert control over any pins associated with the SDOx and SCKx outputs. This does not automatically disable other digital functions associated with the pin and may result in the module driving the digital I/O port inputs. To prevent this, the MSSP module outputs must be disconnected from their output pins while the module is in SPI Master mode. While disabling the module temporarily may be an option, it may not be a practical solution in all applications.

The SDOx and SCKx outputs for the module can be selectively disabled by using the SDOxDIS and SCKxDIS bits in the PADCFG1 register (Register 14-10). Setting the bit disconnects the corresponding output for a particular module from its assigned pin.

**FIGURE 14-1:** **MSSPx BLOCK DIAGRAM (SPI MODE)**

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **SMP:** Sample bit

 SPI Master mode:
 1 = Input data is sampled at the end of data output time
 0 = Input data is sampled at the middle of data output time
 SPI Slave mode:
 SMP must be cleared when SPI is used in Slave mode.

bit 6 **CKE:** SPI Clock Select bit[1]

 1 = Transmit occurs on transition from active to Idle clock state
 0 = Transmit occurs on transition from Idle to active clock state

bit 5 **D/$\overline{\text{A}}$:** Data/Address bit

 Used in I$^2$C™ mode only.

bit 4 **P:** Stop bit

 Used in I$^2$C mode only. This bit is cleared when the MSSPx module is disabled; SSPEN bit is cleared.

bit 3 **S:** Start bit

 Used in I$^2$C mode only.

bit 2 **R/$\overline{\text{W}}$:** Read/Write Information bit

 Used in I$^2$C mode only.

bit 1 **UA:** Update Address bit

 Used in I$^2$C mode only.

bit 0 **BF:** Buffer Full Status bit

 1 = Receive is complete, SSPxBUF is full
 0 = Receive is not complete, SSPxBUF is empty

**Note 1:** Polarity of clock state is set by the CKP bit (SSPxCON1<4>).

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **SMP:** Slew Rate Control bit

In Master or Slave mode:
1 = Slew rate control is disabled for Standard Speed mode (100 kHz and 1 MHz)
0 = Slew rate control is enabled for High-Speed mode (400 kHz)

bit 6 **CKE:** SMBus Select bit

In Master or Slave mode:
1 = Enables SMBus-specific inputs
0 = Disables SMBus-specific inputs

bit 5 **D/$\overline{\text{A}}$:** Data/$\overline{\text{Address}}$ bit

In Master mode:
Reserved.

In Slave mode:
1 = Indicates that the last byte received or transmitted was data
0 = Indicates that the last byte received or transmitted was address

bit 4 **P:** Stop bit[1]

1 = Indicates that a Stop bit has been detected last
0 = Stop bit was not detected last

bit 3 **S:** Start bit[1]

1 = Indicates that a Start bit has been detected last
0 = Start bit was not detected last

bit 2 **R/$\overline{\text{W}}$:** Read/$\overline{\text{Write}}$ Information bit

In Slave mode:[2]
1 = Read
0 = Write

In Master mode:[3]
1 = Transmit is in progress
0 = Transmit is not in progress

bit 1 **UA:** Update Address bit (10-Bit Slave mode only)

1 = Indicates that the user needs to update the address in the SSPxADD register
0 = Address does not need to be updated

**Note 1:** This bit is cleared on Reset and when SSPEN is cleared.

**2:** This bit holds the R/$\overline{\text{W}}$ bit information following the last address match. This bit is only valid from the address match to the next Start bit, Stop bit or not $\overline{\text{ACK}}$ bit.

**3:** ORing this bit with SEN, RSEN, PEN, RCEN or ACKEN will indicate if the MSSPx is in Active mode.

**REGISTER 14-2: SSPxSTAT: MSSPx STATUS REGISTER (I²C™ MODE) (CONTINUED)**

bit 0    **BF:** Buffer Full Status bit

<u>In Transmit mode:</u>
1 = Transmit is in progress, SSPxBUF is full
0 = Transmit is complete, SSPxBUF is empty

<u>In Receive mode:</u>
1 = SSPxBUF is full (does not include the $\overline{ACK}$ and Stop bits)
0 = SSPxBUF is empty (does not include the $\overline{ACK}$ and Stop bits)

**Note 1:** This bit is cleared on Reset and when SSPEN is cleared.

**2:** This bit holds the R/$\overline{W}$ bit information following the last address match. This bit is only valid from the address match to the next Start bit, Stop bit or not $\overline{ACK}$ bit.

**3:** ORing this bit with SEN, RSEN, PEN, RCEN or ACKEN will indicate if the MSSPx is in Active mode.

**REGISTER 14-3: SSPxCON1: MSSPx CONTROL REGISTER 1 (SPI MODE)**

|---|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **WCOL:** Write Collision Detect bit
1 = The SSPxBUF register is written while it is still transmitting the previous word (must be cleared in software)
0 = No collision

bit 6 **SSPOV:** Master Synchronous Serial Port Receive Overflow Indicator bit[1]

SPI Slave mode:
1 = A new byte is received while the SSPxBUF register is still holding the previous data. In case of overflow, the data in SSPxSR is lost. Overflow can only occur in Slave mode. The user must read the SSPxBUF, even if only transmitting data, to avoid setting overflow (must be cleared in software).
0 = No overflow

bit 5 **SSPEN:** Master Synchronous Serial Port Enable bit[2]
1 = Enables the serial port and configures SCKx, SDOx, SDIx and $\overline{SSx}$ as serial port pins
0 = Disables the serial port and configures these pins as I/O port pins

bit 4 **CKP:** Clock Polarity Select bit
1 = Idle state for clock is a high level
0 = Idle state for clock is a low level

bit 3-0 **SSPM<3:0>:** Master Synchronous Serial Port Mode Select bits[3]
1010 = SPI Master mode, Clock = F$_{OSC}$/(2 * ([SSPxADD] + 1))
0101 = SPI Slave mode, Clock = SCKx pin; $\overline{SSx}$ pin control is disabled, $\overline{SSx}$ can be used as an I/O pin
0100 = SPI Slave mode, Clock = SCKx pin; $\overline{SSx}$ pin control is enabled
0011 = SPI Master mode, Clock = TMR2 output/2
0010 = SPI Master mode, Clock = F$_{OSC}$/32
0001 = SPI Master mode, Clock = F$_{OSC}$/8
0000 = SPI Master mode, Clock = F$_{OSC}$/2

**Note 1:** In Master mode, the overflow bit is not set since each new reception (and transmission) is initiated by writing to the SSPxBUF register.

**2:** When enabled, these pins must be properly configured as inputs or outputs.

**3:** Bit combinations not specifically listed here are either reserved or implemented in I$^2$C™ mode only.

bit 15-8      **Unimplemented:** Read as '0'

bit 7         **WCOL:** Write Collision Detect bit

<u>In Master Transmit mode:</u>
1 = A write to the SSPxBUF register was attempted while the I²C conditions were not valid for a transmission to be started (must be cleared in software)
0 = No collision
<u>In Slave Transmit mode:</u>
1 = The SSPxBUF register is written while it is still transmitting the previous word (must be cleared in software)
0 = No collision
<u>In Receive mode (Master or Slave modes):</u>
This is a "don't care" bit.

bit 6         **SSPOV:** Master Synchronous Serial Port Receive Overflow Indicator bit

<u>In Receive mode:</u>
1 = A byte is received while the SSPxBUF register is still holding the previous byte (must be cleared in software)
0 = No overflow
<u>In Transmit mode:</u>
This is a "don't care" bit in Transmit mode.

bit 5         **SSPEN:** Master Synchronous Serial Port Enable bit[1]

1 = Enables the serial port and configures the SDAx and SCLx pins as the serial port pins
0 = Disables the serial port and configures these pins as I/O port pins

bit 4         **CKP:** SCLx Release Control bit

<u>In Slave mode:</u>
1 = Releases clock
0 = Holds clock low (clock stretch), used to ensure data setup time
<u>In Master mode:</u>
Unused in this mode.

bit 3-0       **SSPM<3:0>:** Master Synchronous Serial Port Mode Select bits[2]

1111 = I²C Slave mode, 10-bit address with Start and Stop bit interrupts enabled
1110 = I²C Slave mode, 7-bit address with Start and Stop bit interrupts enabled
1011 = I²C Firmware Controlled Master mode (Slave Idle)
1000 = I²C Master mode, Clock = F$_{OSC}$/(2 * ([SSPxADD] + 1))[3]
0111 = I²C Slave mode, 10-bit address
0110 = I²C Slave mode, 7-bit address

**Note 1:** When enabled, the SDAx and SCLx pins must be configured as inputs.

**2:** Bit combinations not specifically listed here are either reserved or implemented in SPI mode only.

**3:** SSPxADD values of 0, 1 or 2 are not supported when the Baud Rate Generator is used with I²C mode.

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **GCEN:** General Call Enable bit (Slave mode only)

1 = Enables interrupt when a general call address (0000h) is received in the SSPxSR
0 = General call address is disabled

bit 6 **ACKSTAT:** Acknowledge Status bit (Master Transmit mode only)

1 = Acknowledge was not received from slave
0 = Acknowledge was received from slave

bit 5 **ACKDT:** Acknowledge Data bit (Master Receive mode only)[1]

1 = No Acknowledge
0 = Acknowledge

bit 4 **ACKEN:** Acknowledge Sequence Enable bit (Master mode only)[2]

1 = Initiates Acknowledge sequence on SDAx and SCLx pins and transmits ACKDT data bit; automatically cleared by hardware
0 = Acknowledge sequence is Idle

bit 3 **RCEN:** Receive Enable bit (Master Receive mode only)[2]

1 = Enables Receive mode for I$^2$C
0 = Receive is Idle

bit 2 **PEN:** Stop Condition Enable bit (Master mode only)[2]

1 = Initiates Stop condition on SDAx and SCLx pins; automatically cleared by hardware
0 = Stop condition is Idle

bit 1 **RSEN:** Repeated Start Condition Enable bit (Master mode only)[2]

1 = Initiates Repeated Start condition on SDAx and SCLx pins; automatically cleared by hardware
0 = Repeated Start condition is Idle

bit 0 **SEN:** Start Condition Enable bit[2]

Master Mode:

1 = Initiates Start condition on SDAx and SCLx pins; automatically cleared by hardware
0 = Start condition is Idle
Slave Mode:

1 = Clock stretching is enabled for both slave transmit and slave receive (stretch is enabled)
0 = Clock stretching is disabled

**Note 1:** The value that will be transmitted when the user initiates an Acknowledge sequence at the end of a receive.

**2:** If the I$^2$C module is active, these bits may not be set (no spooling) and the SSPxBUF may not be written (or writes to the SSPxBUF are disabled).

**NOTES:**

## 15.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Universal Asynchronous Receiver Transmitter, refer to the *"PIC24F Family Reference Manual"*, **"UART"** (DS39708).

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in this PIC24F device family. The UART is a full-duplex, asynchronous system that can communicate with peripheral devices, such as personal computers, LIN/J2602, RS-232 and RS-485 interfaces. This module also supports a hardware flow control option with the $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins, and also includes an IrDA® encoder and decoder.

The primary features of the UART module are:

- Full-Duplex, 8-Bit or 9-Bit Data Transmission through the UxTX and UxRX Pins
- Even, Odd or No Parity Options (for 8-bit data)
- One or Two Stop bits
- Hardware Flow Control Option with $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ Pins
- Fully Integrated Baud Rate Generator (IBRG) with 16-Bit Prescaler

- Baud Rates Ranging from 1 Mbps to 15 bps at 16 MIPS
- 4-Deep, First-In-First-Out (FIFO) Transmit Data Buffer
- 4-Deep FIFO Receive Data Buffer
- Parity, Framing and Buffer Overrun Error Detection
- Support for 9-Bit mode with Address Detect ($9^{th}$ bit = 1)
- Transmit and Receive Interrupts
- Loopback mode for Diagnostic Support
- Support for Sync and Break Characters
- Supports Automatic Baud Rate Detection
- IrDA® Encoder and Decoder Logic
- 16x Baud Clock Output for IrDA Support

A simplified block diagram of the UARTx module is shown in Figure 15-1. The UARTx module consists of these important hardware elements:

- Baud Rate Generator
- Asynchronous Transmitter
- Asynchronous Receiver

> **Note:** Throughout this section, references to register and bit names that may be associated with a specific USART module are referred to generically by the use of 'x' in place of the specific module number. Thus, "UxSTA" might refer to the USART Status register for either USART1 or USART2.

FIGURE 15-1: UARTx MODULE SIMPLIFIED BLOCK DIAGRAM
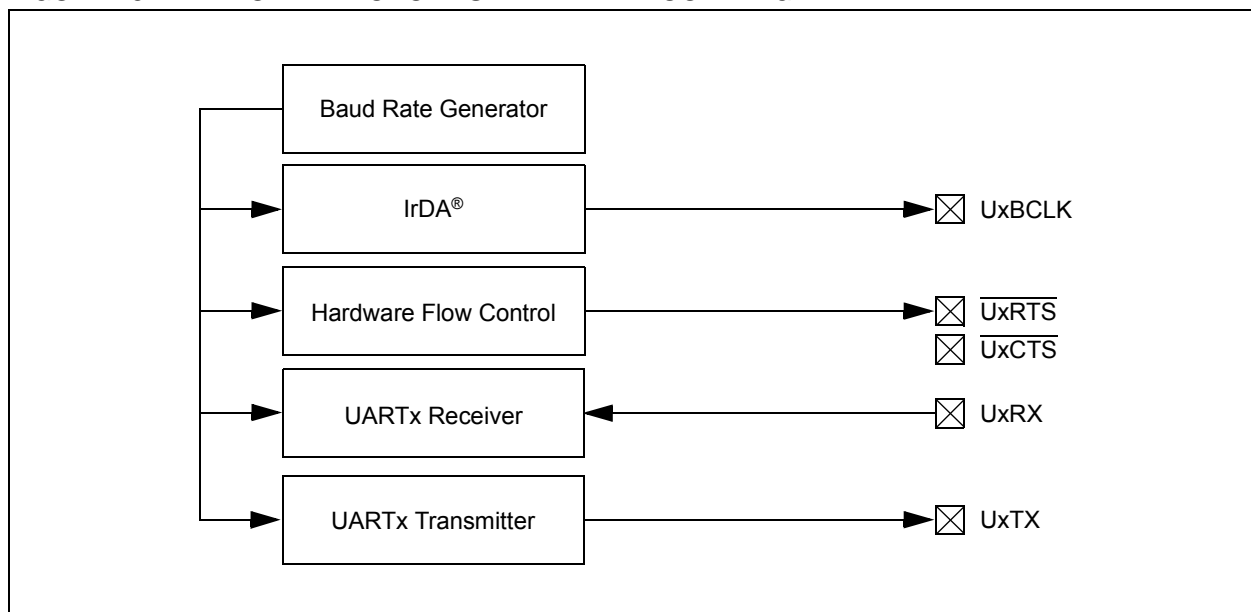

## 15.1 UARTx Baud Rate Generator (BRG)

The UARTx module includes a dedicated 16-bit Baud Rate Generator (BRG). The UxBRG register controls the period of a free-running, 16-bit timer. Equation 15-1 provides the formula for computation of the baud rate with BRGH = 0.

**EQUATION 15-1: UARTx BAUD RATE WITH BRGH = 0[1]**

$$\text{Baud Rate} = \frac{\text{F}_{CY}}{16 \cdot (\text{UxBRG} + 1)}$$

$$\text{UxBRG} = \frac{\text{F}_{CY}}{16 \cdot \text{Baud Rate}} - 1$$

> **Note 1:** Based on F$_{CY}$ = F$_{OSC}$/2; Doze mode and PLL are disabled.

Example 15-1 provides the calculation of the baud rate error for the following conditions:

- F$_{CY}$ = 4 MHz
- Desired Baud Rate = 9600

The maximum baud rate (BRGH = 0) possible is F$_{CY}$/16 (for UxBRG = 0) and the minimum baud rate possible is F$_{CY}$/(16 * 65536).

Equation 15-2 shows the formula for computation of the baud rate with BRGH = 1.

**EQUATION 15-2: UARTx BAUD RATE WITH BRGH = 1[1]**

$$\text{Baud Rate} = \frac{\text{F}_{CY}}{4 \cdot (\text{UxBRG} + 1)}$$

$$\text{UxBRG} = \frac{\text{F}_{CY}}{4 \cdot \text{Baud Rate}} - 1$$

> **Note 1:** Based on F$_{CY}$ = F$_{OSC}$/2; Doze mode and PLL are disabled.

The maximum baud rate (BRGH = 1) possible is F$_{CY}$/4 (for UxBRG = 0) and the minimum baud rate possible is F$_{CY}$/(4 * 65536).

Writing a new value to the UxBRG register causes the BRG timer to be reset (cleared). This ensures the BRG does not wait for a timer overflow before generating the new baud rate.

**EXAMPLE 15-1: BAUD RATE ERROR CALCULATION (BRGH = 0)[1]**

Desired Baud Rate = F$_{CY}$/(16 (UxBRG + 1))

Solving for UxBRG value:

UxBRG = ((F$_{CY}$/Desired Baud Rate)/16) – 1
UxBRG = ((4000000/9600)/16) – 1
UxBRG = 25

Calculated Baud Rate = 4000000/(16 (25 + 1))
= 9615

Error = (Calculated Baud Rate – Desired Baud Rate)
Desired Baud Rate
= (9615 – 9600)/9600
= 0.16%

> **Note 1:** Based on F$_{CY}$ = F$_{OSC}$/2; Doze mode and PLL are disabled.

## 15.2 Transmitting in 8-Bit Data Mode

1. Set up the UARTx:
   a) Write the appropriate values for data, parity and Stop bits.
   b) Write the appropriate baud rate value to the UxBRG register.
   c) Set up transmit and receive interrupt enable and priority bits.
2. Enable the UARTx.
3. Set the UTXEN bit (causes a transmit interrupt, two cycles after being set).
4. Write the data byte to the lower byte of the UxTXREG word. The value will be immediately transferred to the Transmit Shift Register (TSR) and the serial bit stream will start shifting out with the next rising edge of the baud clock.
5. Alternately, the data byte may be transferred while UTXEN = 0, and then, the user may set UTXEN. This will cause the serial bit stream to begin immediately, because the baud clock will start from a cleared state.
6. A transmit interrupt will be generated as per interrupt control bit, UTXISELx.

## 15.3 Transmitting in 9-Bit Data Mode

1. Set up the UARTx (as described in **Section 15.2 "Transmitting in 8-Bit Data Mode"**).
2. Enable the UARTx.
3. Set the UTXEN bit (causes a transmit interrupt, two cycles after being set).
4. Write UxTXREG as a 16-bit value only.
5. A word write to UxTXREG triggers the transfer of the 9-bit data to the TSR. The serial bit stream will start shifting out with the first rising edge of the baud clock.
6. A transmit interrupt will be generated as per the setting of control bit, UTXISELx.

## 15.4 Break and Sync Transmit Sequence

The following sequence will send a message frame header, made up of a Break, followed by an Auto-Baud Sync byte.

1. Configure the UARTx for the desired mode.
2. Set UTXEN and UTXBRK – this sets up the Break character.
3. Load the UxTXREG with a dummy character to initiate transmission (value is ignored).
4. Write '55h' to UxTXREG – loads the Sync character into the transmit FIFO.
5. After the Break has been sent, the UTXBRK bit is reset by hardware. The Sync character now transmits.

## 15.5 Receiving in 8-Bit or 9-Bit Data Mode

1. Set up the UARTx (as described in **Section 15.2 "Transmitting in 8-Bit Data Mode"**).
2. Enable the UARTx.
3. A receive interrupt will be generated when one or more data characters have been received, as per interrupt control bit, URXISELx.
4. Read the OERR bit to determine if an overrun error has occurred. The OERR bit must be reset in software.
5. Read UxRXREG.

The act of reading the UxRXREG character will move the next character to the top of the receive FIFO, including a new set of PERR and FERR values.

## 15.6 Operation of UxCTS and UxRTS Control Pins

UARTx Clear-To-Send (UxCTS) and Request-To-Send (UxRTS) are the two hardware controlled pins that are associated with the UARTx module. These two pins allow the UARTx to operate in Simplex and Flow Control modes. They are implemented to control the transmission and reception between the Data Terminal Equipment (DTE). The UEN<1:0> bits in the UxMODE register configure these pins.

## 15.7 Infrared Support

The UARTx module provides two types of infrared UARTx support: one is the IrDA clock output to support an external IrDA encoder and decoder device (legacy module support), and the other is the full implementation of the IrDA encoder and decoder.

As the IrDA modes require a 16x baud clock, they will only work when the BRGH bit (UxMODE<3>) is '0'.

### 15.7.1 EXTERNAL IrDA SUPPORT – IrDA CLOCK OUTPUT

To support external IrDA encoder and decoder devices, the UxBCLK pin (same as the UxRTS pin) can be configured to generate the 16x baud clock. When UEN<1:0> = 11, the UxBCLK pin will output the 16x baud clock if the UARTx module is enabled; it can be used to support the IrDA codec chip.

### 15.7.2 BUILT-IN IrDA ENCODER AND DECODER

The UARTx has full implementation of the IrDA encoder and decoder as part of the UARTx module. The built-in IrDA encoder and decoder functionality is enabled using the IREN bit (UxMODE<12>). When enabled (IREN = 1), the receive pin (UxRX) acts as the input from the infrared receiver. The transmit pin (UxTX) acts as the output to the infrared transmitter.

---

bit 15 **UARTEN:** UARTx Enable bit

1 = UARTx is enabled; all UARTx pins are controlled by UARTx, as defined by UEN<1:0>
0 = UARTx is disabled; all UARTx pins are controlled by port latches, UARTx power consumption is minimal

bit 14 **Unimplemented:** Read as '0'

bit 13 **USIDL:** UARTx Stop in Idle Mode bit

1 = Discontinues module operation when the device enters Idle mode
0 = Continues module operation in Idle mode

bit 12 **IREN:** IrDA® Encoder and Decoder Enable bit[1]

1 = IrDA encoder and decoder are enabled
0 = IrDA encoder and decoder are disabled

bit 11 **RTSMD:** Mode Selection for UxRTS Pin bit

1 = UxRTS pin is in Simplex mode
0 = UxRTS pin is in Flow Control mode

bit 10 **Unimplemented:** Read as '0'

bit 9-8 **UEN<1:0>:** UARTx Enable bits[2]

11 = UxTX, UxRX and UxBCLK pins are enabled and used; UxCTS pin is controlled by port latches
10 = UxTX, UxRX, UxCTS and UxRTS pins are enabled and used
01 = UxTX, UxRX and UxRTS pins are enabled and used; UxCTS pin is controlled by port latches
00 = UxTX and UxRX pins are enabled and used; UxCTS and UxRTS/UxBCLK pins are controlled by port latches

bit 7 **WAKE:** Wake-up on Start Bit Detect During Sleep Mode Enable bit

1 = UARTx will continue to sample the UxRX pin; interrupt is generated on the falling edge, bit is cleared in hardware on the following rising edge
0 = No wake-up is enabled

bit 6 **LPBACK:** UARTx Loopback Mode Select bit

1 = Enables Loopback mode
0 = Loopback mode is disabled

bit 5 **ABAUD:** Auto-Baud Enable bit

1 = Enables baud rate measurement on the next character – requires reception of a Sync field (55h); cleared in hardware upon completion
0 = Baud rate measurement is disabled or completed

bit 4 **URXINV:** UARTx Receive Polarity Inversion bit

1 = UxRX Idle state is '0'
0 = UxRX Idle state is '1'

**Note 1:** This feature is is only available for the 16x BRG mode (BRGH = 0).

**2:** The bit availability depends on the pin availability.

**REGISTER 15-1:** **UxMODE: UARTx MODE REGISTER (CONTINUED)**

bit 3      **BRGH:** High Baud Rate Enable bit

1 = BRG generates 4 clocks per bit period (4x baud clock, High-Speed mode)
0 = BRG generates 16 clocks per bit period (16x baud clock, Standard mode)

bit 2-1      **PDSEL<1:0>:** Parity and Data Selection bits

11 = 9-bit data, no parity
10 = 8-bit data, odd parity
01 = 8-bit data, even parity
00 = 8-bit data, no parity

bit 0      **STSEL:** Stop Bit Selection bit

1 = Two Stop bits
0 = One Stop bit

**Note 1:**      This feature is is only available for the 16x BRG mode (BRGH = 0).

       **2:**      The bit availability depends on the pin availability.

| HS = Hardware Settable bit | C = Clearable bit | HSC = Hardware Settable/Clearable bit | |
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 15,13 **UTXISEL<1:0>:** UARTx Transmission Interrupt Mode Selection bits

11 = Reserved; do not use
10 = Interrupt when a character is transferred to the Transmit Shift Register (TSR) and as a result, the transmit buffer becomes empty
01 = Interrupt when the last character is shifted out of the Transmit Shift Register; all transmit operations are completed
00 = Interrupt when a character is transferred to the Transmit Shift Register (this implies there is at least one character open in the transmit buffer)

bit 14 **UTXINV:** IrDA® Encoder Transmit Polarity Inversion bit

If IREN = 0:
1 = UxTX Idle '0'
0 = UxTX Idle '1'

If IREN = 1:
1 = UxTX Idle '1'
0 = UxTX Idle '0'

bit 12 **Unimplemented:** Read as '0'

bit 11 **UTXBRK:** UARTx Transmit Break bit

1 = Sends Sync Break on next transmission – Start bit, followed by twelve '0' bits, followed by Stop bit; cleared by hardware upon completion
0 = Sync Break transmission is disabled or completed

bit 10 **UTXEN:** UARTx Transmit Enable bit

1 = Transmit is enabled; UxTX pin is controlled by UARTx
0 = Transmit is disabled; any pending transmission is aborted and the buffer is reset; UxTX pin is controlled by the PORT register

bit 9 **UTXBF:** UARTx Transmit Buffer Full Status bit (read-only)

1 = Transmit buffer is full
0 = Transmit buffer is not full, at least one more character can be written

bit 8 **TRMT:** Transmit Shift Register Empty bit (read-only)

1 = Transmit Shift Register is empty and the transmit buffer is empty (the last transmission has completed)
0 = Transmit Shift Register is not empty; a transmission is in progress or queued

bit 7-6 **URXISEL<1:0>:** UARTx Receive Interrupt Mode Selection bits

11 = Interrupt is set on an RSR transfer, making the receive buffer full (i.e., has 4 data characters)
10 = Interrupt is set on an RSR transfer, making the receive buffer 3/4 full (i.e., has 3 data characters)
0x = Interrupt is set when any character is received and transferred from the RSR to the receive buffer; receive buffer has one or more characters

**REGISTER 15-2:    UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)**

bit 5      **ADDEN:** Address Character Detect bit (bit 8 of received data = 1)

         1 = Address Detect mode is enabled; if 9-bit mode is not selected, this does not take effect
         0 = Address Detect mode is disabled

bit 4      **RIDLE:** Receiver Idle bit (read-only)

         1 = Receiver is Idle
         0 = Receiver is active

bit 3      **PERR:** Parity Error Status bit (read-only)

         1 = Parity error has been detected for the current character (character at the top of the receive FIFO)
         0 = Parity error has not been detected

bit 2      **FERR:** Framing Error Status bit (read-only)

         1 = Framing error has been detected for the current character (character at the top of the receive FIFO)
         0 = Framing error has not been detected

bit 1      **OERR:** Receive Buffer Overrun Error Status bit (clear/read-only)

         1 = Receive buffer has overflowed
         0 = Receive buffer has not overflowed (clearing a previously set OERR bit (1 → 0 transition) will reset the receiver buffer and the RSR to the empty state)

bit 0      **URXDA:** UARTx Receive Buffer Data Available bit (read-only)

         1 = Receive buffer has data; at least one more characters can be read
         0 = Receive buffer is empty

---

## 16.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Real-Time Clock and Calendar, refer to the *"PIC24F Family Reference Manual"*, **"Real-Time Clock and Calendar (RTCC)"** (DS39696).

The RTCC provides the user with a Real-Time Clock and Calendar (RTCC) function that can be calibrated.

Key features of the RTCC module are:

- Operates in Sleep and Retention Sleep modes
- Selectable clock source
- Provides hours, minutes and seconds using 24-hour format
- Visibility of one half second period
- Provides calendar – weekday, date, month and year
- Alarm-configurable for half a second, one second, 10 seconds, one minute, 10 minutes, one hour, one day, one week, one month or one year
- Alarm repeat with decrementing counter
- Alarm with indefinite repeat chime
- Year 2000 to 2099 leap year correction

- BCD format for smaller software overhead
- Optimized for long term battery operation
- User calibration of the 32.768 kHz clock crystal/32K INTRC frequency with periodic auto-adjust
- Optimized for long term battery operation
- Fractional second synchronization
- Calibration to within ±2.64 seconds error per month
- Calibrates up to 260 ppm of crystal error
- Ability to periodically wake-up external devices without CPU intervention (external power control)
- Power control output for external circuit control
- Calibration takes effect every 15 seconds
- Runs from any one of the following:
  - External Real-Time Clock of 32.768 kHz
  - Internal 31.25 kHz LPRC Clock
  - 50 Hz or 60 Hz External Input

### 16.1 RTCC Source Clock

The user can select between the SOSC crystal oscillator, LPRC internal oscillator or an external 50 Hz/60 Hz power line input as the clock reference for the RTCC module. This gives the user an option to trade off system cost, accuracy and power consumption, based on the overall system needs.

**FIGURE 16-1:** RTCC BLOCK DIAGRAM
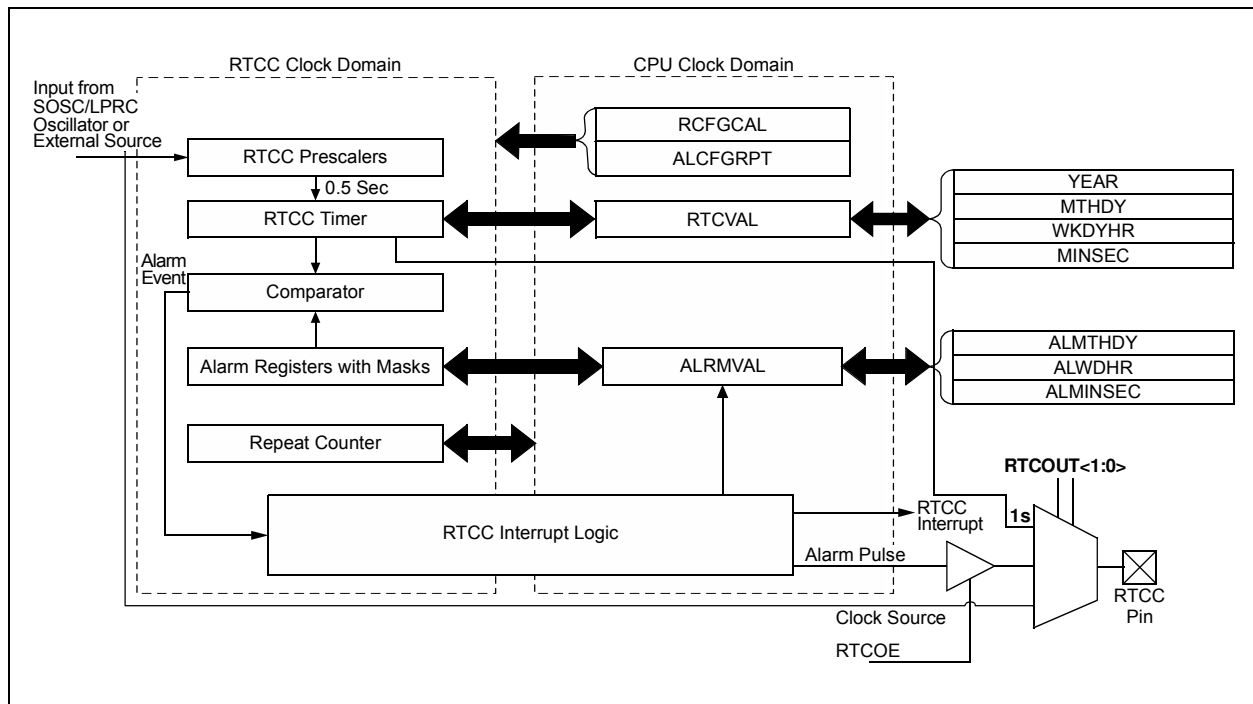

## 16.2    RTCC Module Registers

The RTCC module registers are organized into three categories:

• RTCC Control Registers
• RTCC Value Registers
• Alarm Value Registers

### 16.2.1    REGISTER MAPPING

To limit the register interface, the RTCC Timer and Alarm Time registers are accessed through corresponding register pointers. The RTCC Value register window (RTCVALH and RTCVALL) uses the RTCPTRx bits (RCFGCAL<9:8>) to select the desired Timer register pair (see Table 16-1).

By writing the RTCVALH byte, the RTCC Pointer value, the RTCPTR<1:0> bits decrement by one until they reach '00'. Once they reach '00', the MINUTES and SECONDS value will be accessible through RTCVALH and RTCVALL until the pointer value is manually changed.

### TABLE 16-1:    RTCVAL REGISTER MAPPING

| RTCPTR<1:0> | RTCC Value Register Window | |
| --- | --- | --- |
| | RTCVAL<15:8> | RTCVAL<7:0> |
| 00 | MINUTES | SECONDS |
| 01 | WEEKDAY | HOURS |
| 10 | MONTH | DAY |
| 11 | — | YEAR |

The Alarm Value register window (ALRMVALH and ALRMVALL) uses the ALRMPTRx bits (ALCFGRPT<9:8>) to select the desired Alarm register pair (see Table 16-2).

By writing the ALRMVALH byte, the ALRMPTR<1:0> bits (Alarm Pointer value) decrement by one until they reach '00'. Once they reach '00', the ALRMMIN and ALRMSEC value will be accessible through ALRMVALH and ALRMVALL, until the pointer value is manually changed.

### TABLE 16-2:    ALRMVAL REGISTER MAPPING

| ALRMPTR<1:0> | Alarm Value Register Window | |
| --- | --- | --- |
| | ALRMVALH<15:8> | ALRMVALL<7:0> |
| 00 | ALRMMIN | ALRMSEC |
| 01 | ALRMWD | ALRMHR |
| 10 | ALRMMNTH | ALRMDAY |
| 11 | PWCSTAB | PWCSAMP |

Considering that the 16-bit core does not distinguish between 8-bit and 16-bit read operations, the user must be aware that when reading either the ALRMVALH or ALRMVALL bytes, the ALRMPTR<1:0> value will be decremented. The same applies to the RTCVALH or RTCVALL bytes with the RTCPTR<1:0> being decremented.

| Note: | This only applies to read operations and not write operations. |
| --- | --- |

### 16.2.2    WRITE LOCK

In order to perform a write to any of the RTCC Timer registers, the RTCWREN bit (RCFGCAL<13>) must be set (see Example 16-1 and Example 16-2).

| Note: | To avoid accidental writes to the timer, it is recommended that the RTCWREN bit (RCFGCAL<13>) is kept clear at any other time. For the RTCWREN bit to be set, there is only one instruction cycle time window allowed between the 55h/AA sequence and the setting of RTCWREN. Therefore, it is recommended that code follow the procedure in Example 16-2. |
| --- | --- |

### 16.2.3    SELECTING RTCC CLOCK SOURCE

There are four reference source clock options that can be selected for the RTCC using the RTCCLK<1:0> bits (RTCPWC<11:10>): 00 = Secondary Oscillator, 01 = LPRC, 10 = 50 Hz External Clock and 11 = 60 Hz External Clock.

### EXAMPLE 16-1:    SETTING THE RTCWREN BIT IN ASSEMBLY

```
push   w7              ; Store W7 and W8 values on the stack.
push   w8
disi   #5              ; Disable interrupts until sequence is complete.
mov    #0x55, w7       ; Write 0x55 unlock value to NVMKEY.
mov    w7, NVMKEY
mov    #0xAA, w8       ; Write 0xAA unlock value to NVMKEY.
mov    w8, NVMKEY
bset   RCFGCAL, #13    ; Set the RTCWREN bit.
pop    w8              ; Restore the original W register values from the stack.
pop    w7
```

### EXAMPLE 16-2:    SETTING THE RTCWREN BIT IN 'C'

```
//This builtin function executes implements the unlock sequence and sets
//the RTCWREN bit.
__builtin_write_RTCWEN();
```

## 16.2.4 RTCC CONTROL REGISTERS

### REGISTER 16-1: RCFGCAL: RTCC CALIBRATION AND CONFIGURATION REGISTER[1]

| R/W-0 | U-0 | R/W-0 | R-0, HSC | R-0, HSC | R/W-0 | R/W-0 | R/W-0 |
|-------|-----|-------|----------|----------|-------|-------|-------|
| RTCEN[2] | — | RTCWREN | RTCSYNC | HALFSEC[3] | RTCOE | RTCPTR1 | RTCPTR0 |
| bit 15 | | | | | | | bit 8 |

| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
|-------|-------|-------|-------|-------|-------|-------|-------|
| CAL7 | CAL6 | CAL5 | CAL4 | CAL3 | CAL2 | CAL1 | CAL0 |
| bit 7 | | | | | | | bit 0 |

| Legend: | | HSC = Hardware Settable/Clearable bit | |
|---------|---|-------------------------------------|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 15 **RTCEN:** RTCC Enable bit[2]

    1 = RTCC module is enabled
    0 = RTCC module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **RTCWREN:** RTCC Value Registers Write Enable bit

    1 = RTCVALH and RTCVALL registers can be written to by the user
    0 = RTCVALH and RTCVALL registers are locked out from being written to by the user

bit 12 **RTCSYNC:** RTCC Value Registers Read Synchronization bit

    1 = RTCVALH, RTCVALL and ALCFGRPT registers can change while reading due to a rollover ripple
        resulting in an invalid data read. If the register is read twice and results in the same data, the data
        can be assumed to be valid.
    0 = RTCVALH, RTCVALL or ALCFGRPT registers can be read without concern over a rollover ripple

bit 11 **HALFSEC:** Half Second Status bit[3]

    1 = Second half period of a second
    0 = First half period of a second

bit 10 **RTCOE:** RTCC Output Enable bit

    1 = RTCC output is enabled
    0 = RTCC output is disabled

bit 9-8 **RTCPTR<1:0>:** RTCC Value Register Window Pointer bits

Points to the corresponding RTCC Value registers when reading the RTCVALH and RTCVALL registers. The RTCPTR<1:0> value decrements on every read or write of RTCVALH until it reaches '00'.

RTCVAL<15:8>:
    00 = MINUTES
    01 = WEEKDAY
    10 = MONTH
    11 = Reserved
RTCVAL<7:0>:
    00 = SECONDS
    01 = HOURS
    10 = DAY
    11 = YEAR

**Note 1:** The RCFGCAL register is only affected by a POR.
   **2:** A write to the RTCEN bit is only allowed when RTCWREN = 1.
   **3:** This bit is read-only; it is cleared to '0' on a write to the lower half of the MINSEC register.

**REGISTER 16-1: RCFGCAL: RTCC CALIBRATION AND CONFIGURATION REGISTER[1] (CONTINUED)**

bit 7-0 **CAL<7:0>:** RTC Drift Calibration bits

`01111111` = Maximum positive adjustment; adds 508 RTC clock pulses every one minute
.
.
.
`00000001` = Minimum positive adjustment; adds 4 RTC clock pulses every one minute
`00000000` = No adjustment
`11111111` = Minimum negative adjustment; subtracts 4 RTC clock pulses every one minute
.
.
.
`10000000` = Maximum negative adjustment; subtracts 512 RTC clock pulses every one minute

**Note 1:** The RCFGCAL register is only affected by a POR.
**2:** A write to the RTCEN bit is only allowed when RTCWREN = `1`.
**3:** This bit is read-only; it is cleared to '`0`' on a write to the lower half of the MINSEC register.

### REGISTER 16-2: RTCPWC: RTCC CONFIGURATION REGISTER 2[1]

| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
|---|---|---|---|---|---|---|---|
| PWCEN | PWCPOL | PWCCPRE | PWCSPRE | RTCCLK1[2] | RTCCLK0[2] | RTCOUT1 | RTCOUT0 |
| bit 15 | | | | | | | bit 8 |

| U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 |
|---|---|---|---|---|---|---|---|
| — | — | — | — | — | — | — | — |
| bit 7 | | | | | | | bit 0 |

| Legend: | | |
|---|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared    x = Bit is unknown |

bit 15 **PWCEN:** Power Control Enable bit
1 = Power control is enabled
0 = Power control is disabled

bit 14 **PWCPOL:** Power Control Polarity bit
1 = Power control output is active-high
0 = Power control output is active-low

bit 13 **PWCCPRE:** Power Control/Stability Prescaler bits
1 = PWC stability window clock is divide-by-2 of source RTCC clock
0 = PWC stability window clock is divide-by-1 of source RTCC clock

bit 12 **PWCSPRE:** Power Control Sample Prescaler bits
1 = PWC sample window clock is divide-by-2 of source RTCC clock
0 = PWC sample window clock is divide-by-1 of source RTCC clock

bit 11-10 **RTCCLK<1:0>:** RTCC Clock Select bits[2]
Determines the source of the internal RTCC clock, which is used for all RTCC timer operations.
00 = External Secondary Oscillator (SOSC)
01 = Internal LPRC Oscillator
10 = External power line source – 50 Hz
11 = External power line source – 60 Hz

bit 9-8 **RTCOUT<1:0>:** RTCC Output Select bits
Determines the source of the RTCC pin output.
00 = RTCC alarm pulse
01 = RTCC seconds clock
10 = RTCC clock
11 = Power control

bit 7-0 **Unimplemented:** Read as '0'

Note 1: The RTCPWC register is only affected by a POR.
2: When a new value is written to these register bits, the Seconds Value register should also be written to properly reset the clock prescalers in the RTCC.

# PIC24FV16KM204 FAMILY

## REGISTER 16-3: ALCFGRPT: ALARM CONFIGURATION REGISTER

| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
|---|---|---|---|---|---|---|---|
| ALRMEN | CHIME | AMASK3 | AMASK2 | AMASK1 | AMASK0 | ALRMPTR1 | ALRMPTR0 |

bit 15          bit 8

| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
|---|---|---|---|---|---|---|---|
| ARPT7 | ARPT6 | ARPT5 | ARPT4 | ARPT3 | ARPT2 | ARPT1 | ARPT0 |

bit 7          bit 0

| Legend: | | |
|---|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared    x = Bit is unknown |

bit 15 **ALRMEN:** Alarm Enable bit

1 = Alarm is enabled (cleared automatically after an alarm event whenever ARPT<7:0> = 00h and CHIME = 0)
0 = Alarm is disabled

bit 14 **CHIME:** Chime Enable bit

1 = Chime is enabled; ARPT<7:0> bits are allowed to roll over from 00h to FFh
0 = Chime is disabled; ARPT<7:0> bits stop once they reach 00h

bit 13-10 **AMASK<3:0>:** Alarm Mask Configuration bits

0000 = Every half second
0001 = Every second
0010 = Every 10 seconds
0011 = Every minute
0100 = Every 10 minutes
0101 = Every hour
0110 = Once a day
0111 = Once a week
1000 = Once a month
1001 = Once a year (except when configured for February 29$^{th}$, once every 4 years)
101x = Reserved – do not use
11xx = Reserved – do not use

bit 9-8 **ALRMPTR<1:0>:** Alarm Value Register Window Pointer bits

Points to the corresponding Alarm Value registers when reading the ALRMVALH and ALRMVALL registers. The ALRMPTR<1:0> value decrements on every read or write of ALRMVALH until it reaches '00'.
ALRMVAL<15:8>:
00 = ALRMMIN
01 = ALRMWD
10 = ALRMMNTH
11 = Unimplemented
ALRMVAL<7:0>:
00 = ALRMSEC
01 = ALRMHR
10 = ALRMDAY
11 = Unimplemented

bit 7-0 **ARPT<7:0>:** Alarm Repeat Counter Value bits

11111111 = Alarm will repeat 255 more times
.
.
.
00000000 = Alarm will not repeat
The counter decrements on any alarm event; it is prevented from rolling over from 00h to FFh unless CHIME = 1.

| Legend: | | |
|---------|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared    x = Bit is unknown |

bit 15-8 **PWCSTAB<7:0>:** PWM Stability Window Timer bits

11111111 = Stability window is 255 $T_{PWCCLK}$ clock periods

.
.
.

00000000 = Stability window is 0 $T_{PWCCLK}$ clock periods

The sample window starts when the alarm event triggers. The stability window timer starts counting from every alarm event when PWCEN = 1.

bit 7-0 **PWCSAMP<7:0>:** PWM Sample Window Timer bits

11111111 = Sample window is always enabled, even when PWCEN = 0

11111110 = Sample window is 254 $T_{PWCCLK}$ clock periods

.
.
.

00000000 = Sample window is 0 $T_{PWCCLK}$ clock periods

The sample window timer starts counting at the end of the stability window when PWCEN = 1. If PWCSTAB<7:0> = 00000000, the sample window timer starts counting from every alarm event when PWCEN = 1.

**Note  1:**    A write to this register is only allowed when RTCWREN = 1.

---

## 16.3    Calibration

The real-time crystal input can be calibrated using the periodic auto-adjust feature. When properly calibrated, the RTCC can provide an error of less than 3 seconds per month. This is accomplished by finding the number of error clock pulses and storing the value into the lower half of the RCFGCAL register. The 8-bit signed value, loaded into the lower half of RCFGCAL, is multiplied by four and will be either added or subtracted from the RTCC timer, once every minute. Refer to the steps below for RTCC calibration:

1. Using another timer resource on the device, the user must find the error of the 32.768 kHz crystal.
2. Once the error is known, it must be converted to the number of error clock pulses per minute.
3. a) If the oscillator is faster than ideal (negative result from Step 2), the RCFGCAL register value must be negative. This causes the specified number of clock pulses to be subtracted from the timer counter, once every minute.

   b) If the oscillator is slower than ideal (positive result from Step 2), the RCFGCAL register value must be positive. This causes the specified number of clock pulses to be subtracted from the timer counter, once every minute.

### EQUATION 16-1:

$$\text{(Ideal Frequency†} - \text{Measured Frequency)} *$$
$$60 = \text{Clocks per Minute}$$

†  Ideal Frequency = 32,768 Hz

Writes to the lower half of the RCFGCAL register should only occur when the timer is turned off, or immediately after the rising edge of the seconds pulse, except when SECONDS = 00, 15, 30 or 45. This is due to the auto-adjust of the RTCC at 15 second intervals.

> **Note:** It is up to the user to include, in the error value, the initial error of the crystal: drift due to temperature and drift due to crystal aging.

## 16.4    Alarm

- Configurable from half second to one year
- Enabled using the ALRMEN bit (ALCFGRPT<15>)
- One-time alarm and repeat alarm options are available

### 16.4.1    CONFIGURING THE ALARM

The alarm feature is enabled using the ALRMEN bit. This bit is cleared when an alarm is issued. Writes to ALRMVAL should only take place when ALRMEN = 0.

As shown in Figure 16-2, the interval selection of the alarm is configured through the AMASKx bits (ALCFGRPT<13:10>). These bits determine which and how many digits of the alarm must match the clock value for the alarm to occur.

The alarm can also be configured to repeat based on a preconfigured interval. The amount of times this occurs, once the alarm is enabled, is stored in the ARPT<7:0> bits (ALCFGRPT<7:0>). When the value of the ARPTx bits equals 00h and the CHIME bit (ALCFGRPT<14>) is cleared, the repeat function is disabled, and only a single alarm will occur. The alarm can be repeated up to 255 times by loading ARPT<7:0> with FFh.

After each alarm is issued, the value of the ARPTx bits is decremented by one. Once the value has reached 00h, the alarm will be issued one last time, after which, the ALRMEN bit will be cleared automatically and the alarm will turn off.

Indefinite repetition of the alarm can occur if the CHIME bit = 1. Instead of the alarm being disabled when the value of the ARPTx bits reaches 00h, it rolls over to FFh and continues counting indefinitely while CHIME is set.

### 16.4.2    ALARM INTERRUPT

At every alarm event, an interrupt is generated. In addition, an alarm pulse output is provided that operates at half the frequency of the alarm. This output is completely synchronous to the RTCC clock and can be used as a Trigger clock to other peripherals.

> **Note:** Changing any of the registers, other than the RCFGCAL and ALCFGRPT registers, and the CHIME bit while the alarm is enabled (ALRMEN = 1), can result in a false alarm event leading to a false alarm interrupt. To avoid a false alarm event, the timer and alarm values should only be changed while the alarm is disabled (ALRMEN = 0). It is recommended that the ALCFGRPT register and CHIME bit be changed when RTCSYNC = 0.

**FIGURE 16-2:** ALARM MASK SETTINGS

| Alarm Mask Setting (AMASK<3:0>) | Day of the Week | Month | | Day | | Hours | | Minutes | | Seconds | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 0000 - Every half second<br>0001 - Every second | | | / | | | | : | | : | | |
| 0010 - Every 10 seconds | | | / | | | | : | | : | | s |
| 0011 - Every minute | | | / | | | | : | | : | s | s |
| 0100 - Every 10 minutes | | | / | | | | : | m | : | s | s |
| 0101 - Every hour | | | / | | | | : m | m | : | s | s |
| 0110 - Every day | | | / | | | h | h : | m | m : | s | s |
| 0111 - Every week | d | | / | | | h | h : | m | m : | s | s |
| 1000 - Every month | | | / | d | d | h | h : | m | m : | s | s |
| 1001 - Every year(1) | | m | m / | d | d | h | h : | m | m : | s | s |

**Note 1:** Annually, except when configured for February 29.

## 16.5 Power Control

The RTCC includes a power control feature that allows the device to periodically wake-up an external device, wait for the device to be stable before sampling wake-up events from that device and then shut down the external device. This can be done completely autonomously by the RTCC, without the need to wake from the current low-power mode (Sleep, Deep Sleep, etc.).

To enable this feature, the RTCC must be enabled (RTCEN = 1), the PWCEN register bit must be set and the RTCC pin must be driving the PWC control signal (RTCOE = 1 and RTCCLK<1:0> = 11).

The polarity of the PWC control signal may be chosen using the PWCPOL register bit. Active-low or active-high may be used with the appropriate external switch to turn on or off the power to one or more external devices. The active-low setting may also be used in conjunction with an open-drain setting on the RTCC pin. This setting is able to drive the GND pin(s) of the external device directly (with the appropriate external V$_{DD}$ pull-up device), without the need for external switches. Finally, the CHIME bit should be set to enable the PWC periodicity.

**NOTES:**

## 17.0 CONFIGURABLE LOGIC CELL (CLC)

The Configurable Logic Cell (CLC) module allows the user to specify combinations of signals as inputs to a logic function and to use the logic output to control other peripherals or I/O pins. This provides greater flexibility and potential in embedded designs since the CLC module can operate outside the limitations of software execution and supports a vast amount of output designs.

There are four input gates to the selected logic function. These four input gates select from a pool of up to 32 signals that are selected using four data source selection multiplexers. Figure 17-1 shows an overview of the module. Figure 17-3 shows the details of the data source multiplexers and logic input gate connections.

**FIGURE 17-1: CLCx MODULE**

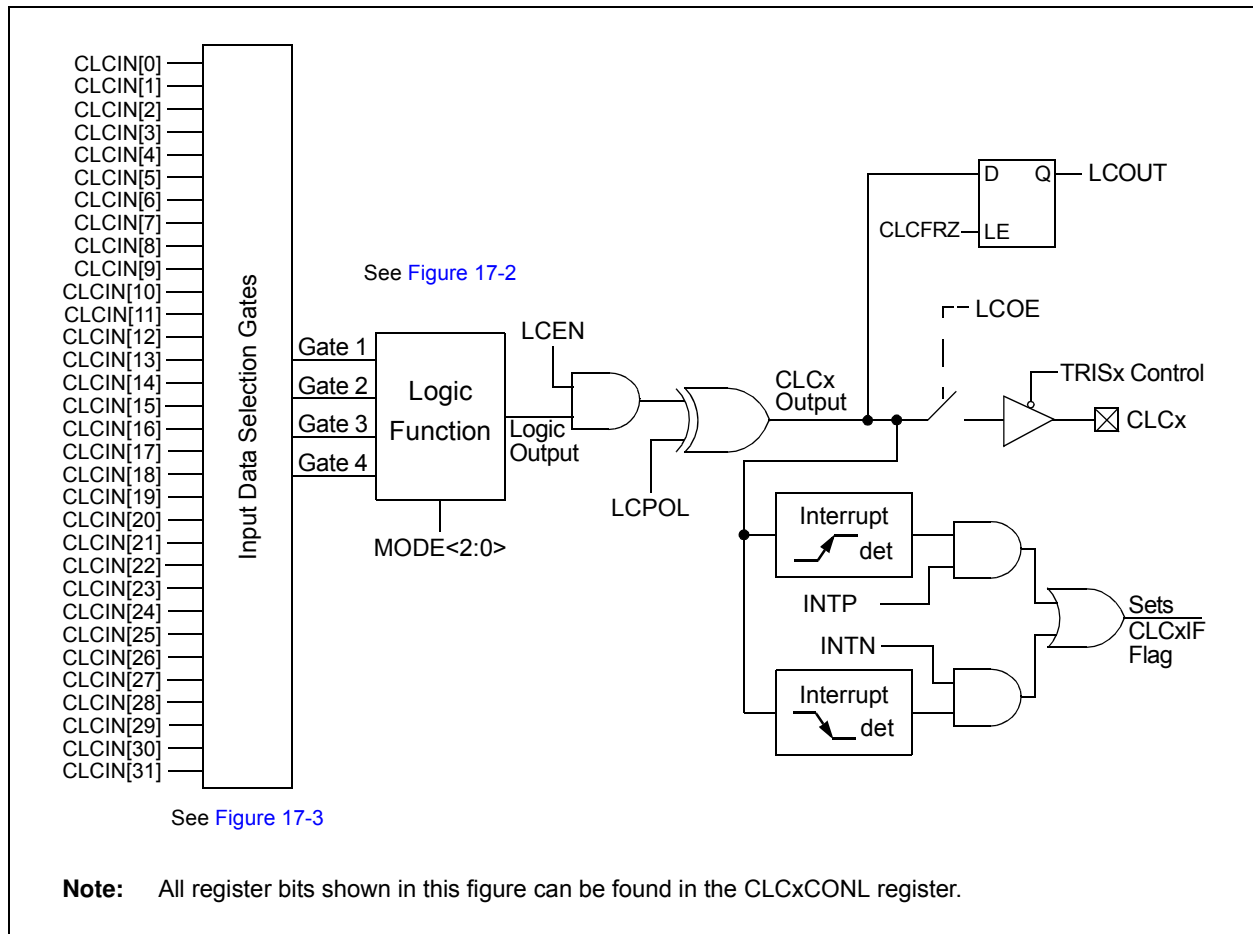

Note: All register bits shown in this figure can be found in the CLCxCONL register.

**FIGURE 17-2:** CLCx LOGIC FUNCTION COMBINATORIAL OPTIONS

     © 2013 Microchip Technology Inc.
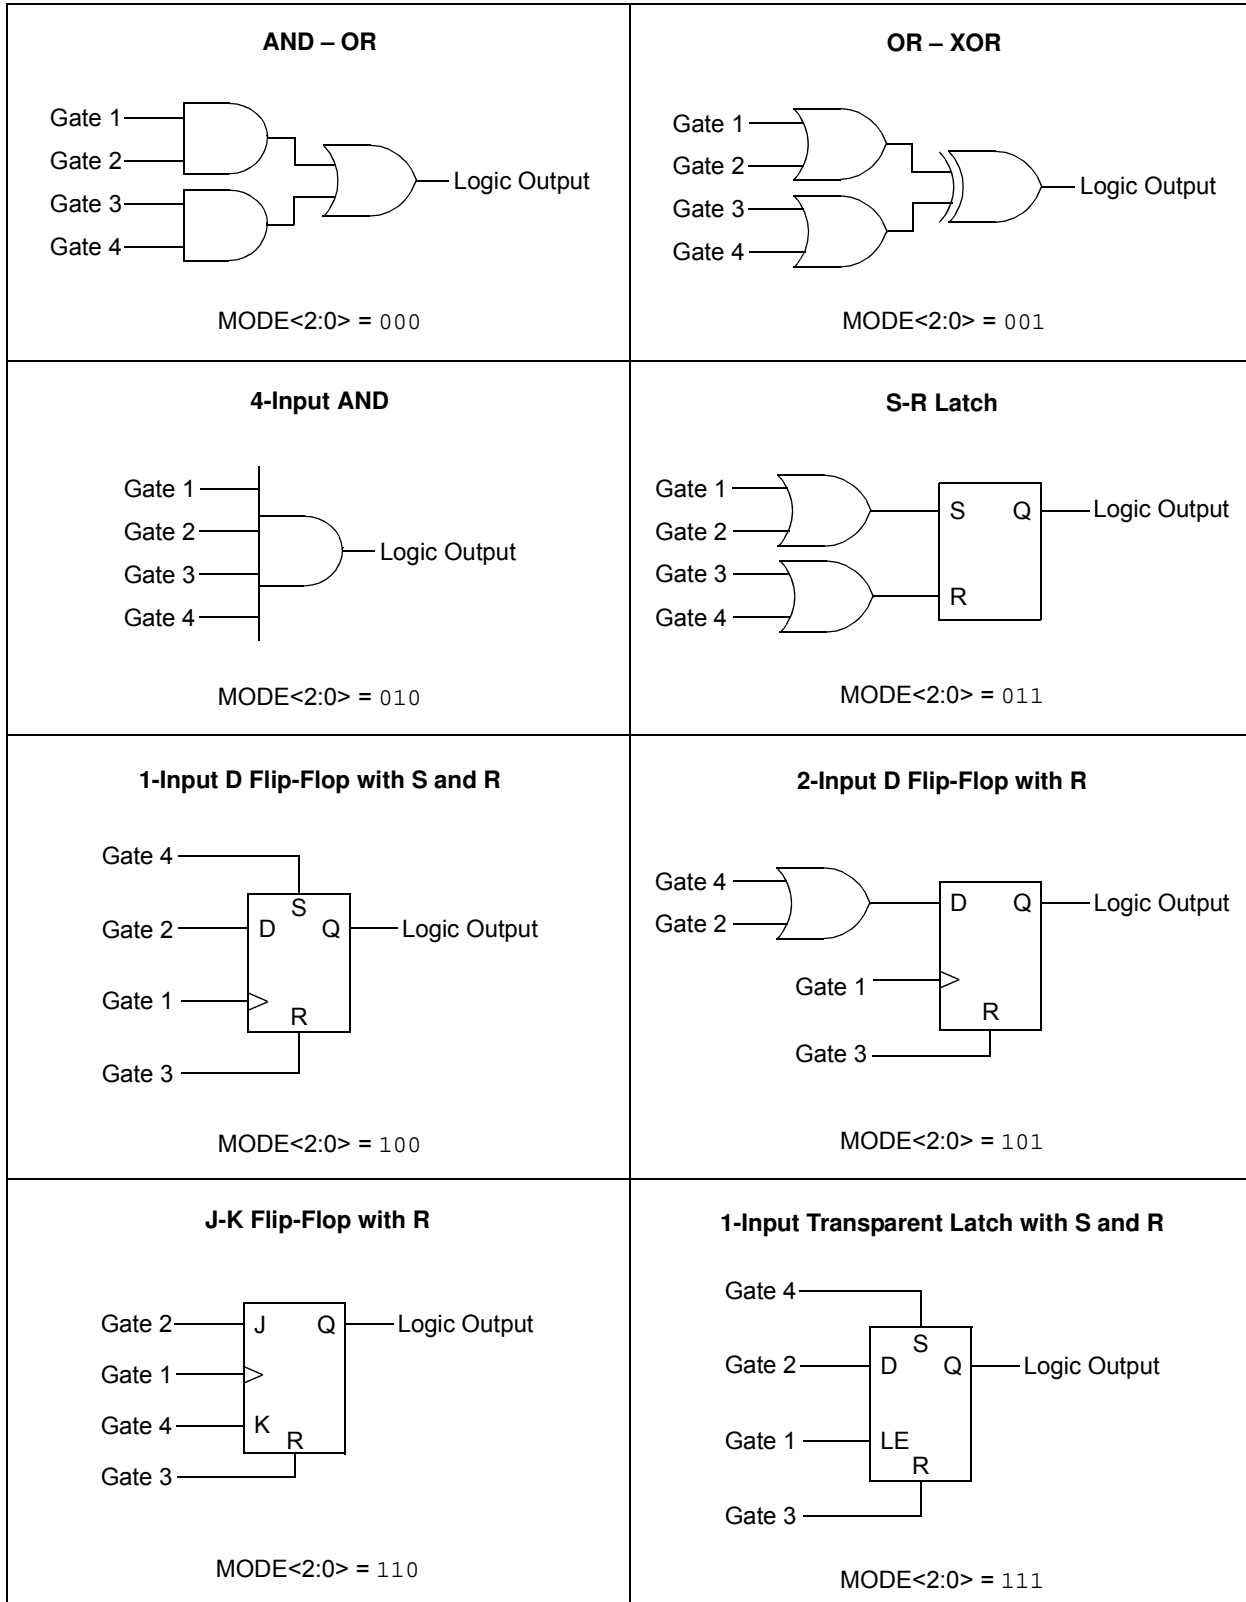

**FIGURE 17-3:** **CLCx INPUT SOURCE SELECTION DIAGRAM**

**Note:** All controls are undefined at power-up.
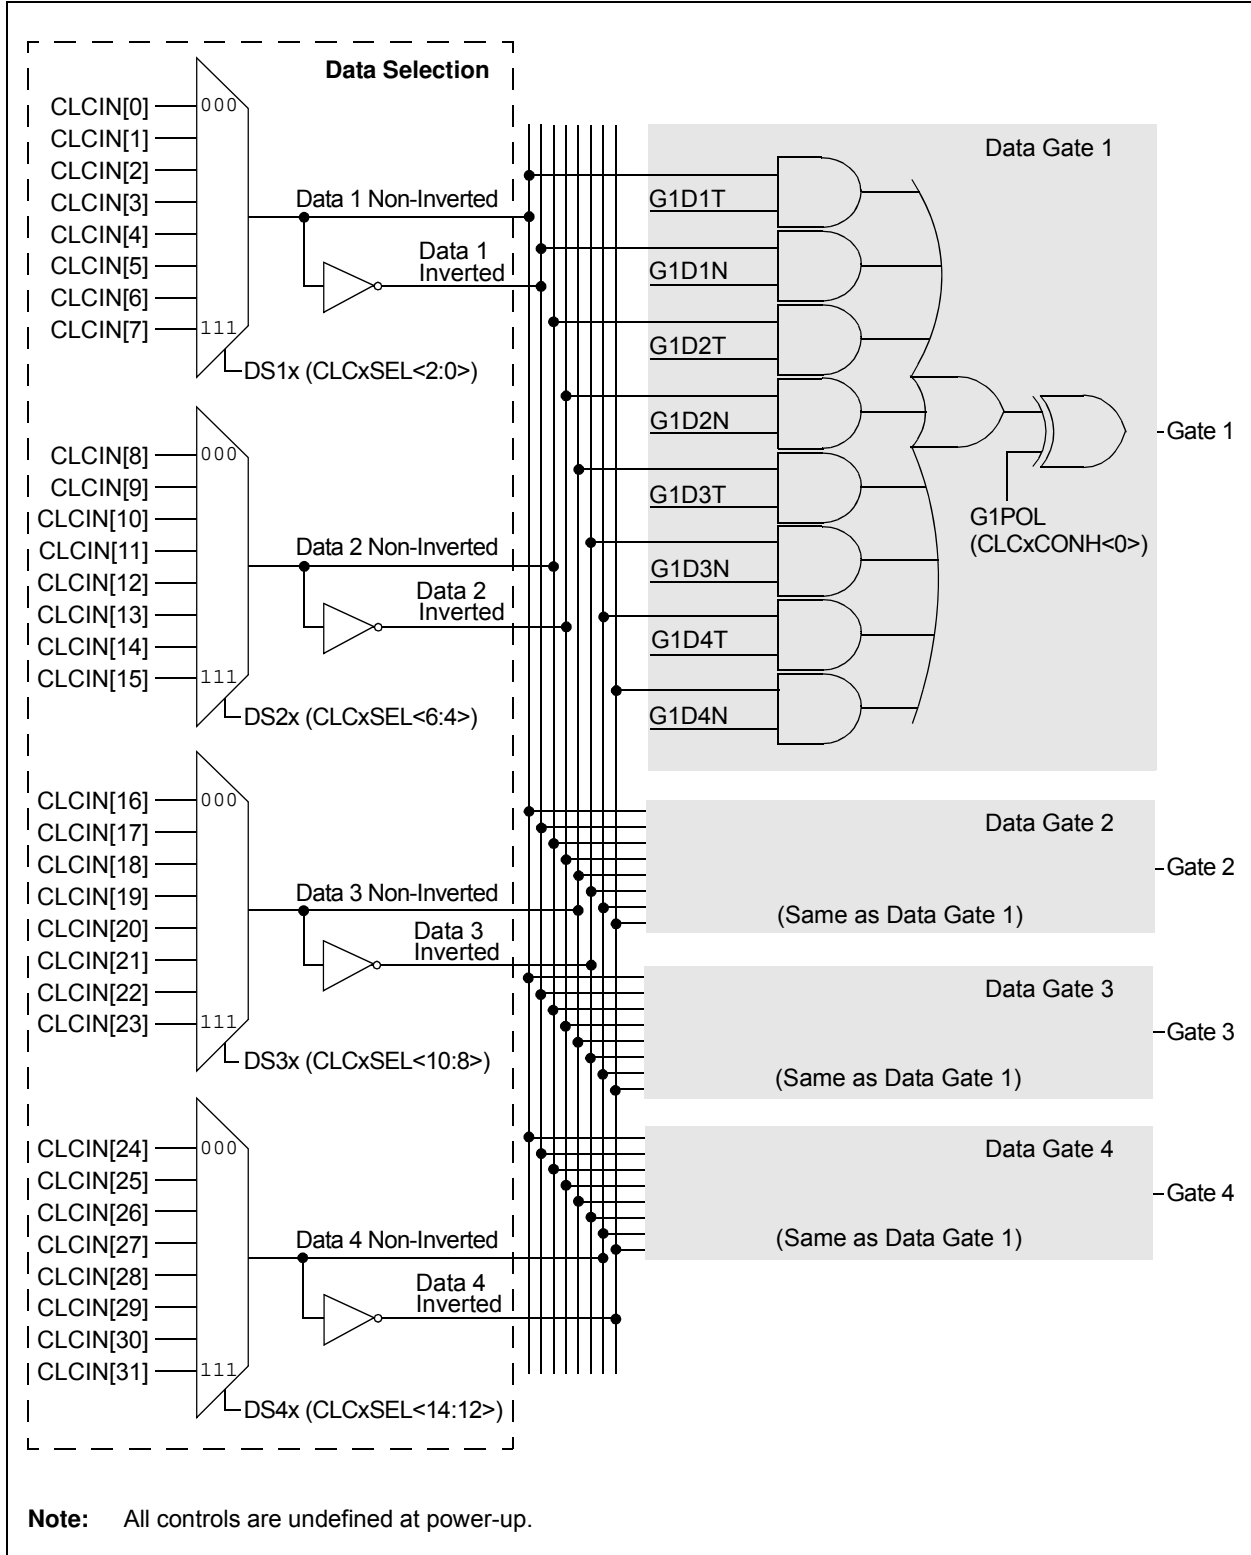

## 17.1 Control Registers

The CLCx module is controlled by the following registers:

- CLCxCONL
- CLCxCONH
- CLCxSEL
- CLCxGLSL
- CLCxGLSH

The CLCx Control registers (CLCxCONL and CLCxCONH) are used to enable the module and interrupts, control the output enable bit, select output polarity and select the logic function. The CLCx Control registers also allow the user to control the logic polarity of not only the cell output, but also some intermediate variables.

The CLCx Source Select register (CLCxSEL) allows the user to select up to 4 data input sources using the 4 data input selection multiplexers. Each multiplexer has a list of 8 data sources available.

The CLCx Gate Logic Select registers (CLCxGLSL and CLCxGLSH) allow the user to select which outputs from each of the selection MUXes are used as inputs to the input gates of the logic cell. Each data source MUX outputs both a true and a negated version of its output. All of these 8 signals are enabled, ORed together by the logic cell input gates.

**NOTES:**

## 18.0 HIGH/LOW-VOLTAGE DETECT (HLVD)

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the High/Low-Voltage Detect, refer to the *"PIC24F Family Reference Manual"*, **"High-Level Integration with Programmable High/Low-Voltage Detect (HLVD)"** (DS39725).

The High/Low-Voltage Detect module (HLVD) is a programmable circuit that allows the user to specify both the device voltage trip point and the direction of change.

An interrupt flag is set if the device experiences an excursion past the trip point in the direction of change. If the interrupt is enabled, the program execution will branch to the interrupt vector address and the software can then respond to the interrupt.

The HLVD Control register (see Register 18-1) completely controls the operation of the HLVD module. This allows the circuitry to be "turned off" by the user under software control, which minimizes the current consumption for the device.

## 19.0 12-BIT A/D CONVERTER WITH THRESHOLD DETECT

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the 12-Bit A/D Converter with Threshold Detect, refer to the *"PIC24F Family Reference Manual"*, **"12-Bit A/D Converter with Threshold Detect"** (DS39739).

The PIC24F 12-bit A/D Converter has the following key features:

- Successive Approximation Register (SAR) Conversion
- Conversion Speeds of up to 100 ksps
- Up to 32 Analog Input Channels (internal and external)
- Multiple Internal Reference Input Channels
- External Voltage Reference Input Pins
- Unipolar Differential Sample-and-Hold (S/H) Amplifier
- Automated Threshold Scan and Compare Operation to Pre-Evaluate Conversion Results
- Selectable Conversion Trigger Source
- Fixed-Length (one word per channel), Configurable Conversion Result Buffer
- Four Options for Results Alignment
- Configurable Interrupt Generation
- Operation During CPU Sleep and Idle modes

The 12-bit A/D Converter module is an enhanced version of the 10-bit module offered in some PIC24 devices. Both modules are Successive Approximation Register (SAR) converters at their cores, surrounded by a range of hardware features for flexible configuration. This version of the module extends functionality by providing 12-bit resolution, a wider range of automatic sampling options and tighter integration with other analog modules, such as the CTMU, and a configurable results buffer. There is a legacy 10-bit mode on this A/D to allow the option to run with lower resolution in order to obtain higher throughput. This module also includes a unique Threshold Detect feature that allows the module itself to make simple decisions based on the conversion results.

A simplified block diagram for the module is illustrated in Figure 19-1.

**FIGURE 19-1:** **12-BIT A/D CONVERTER BLOCK DIAGRAM**
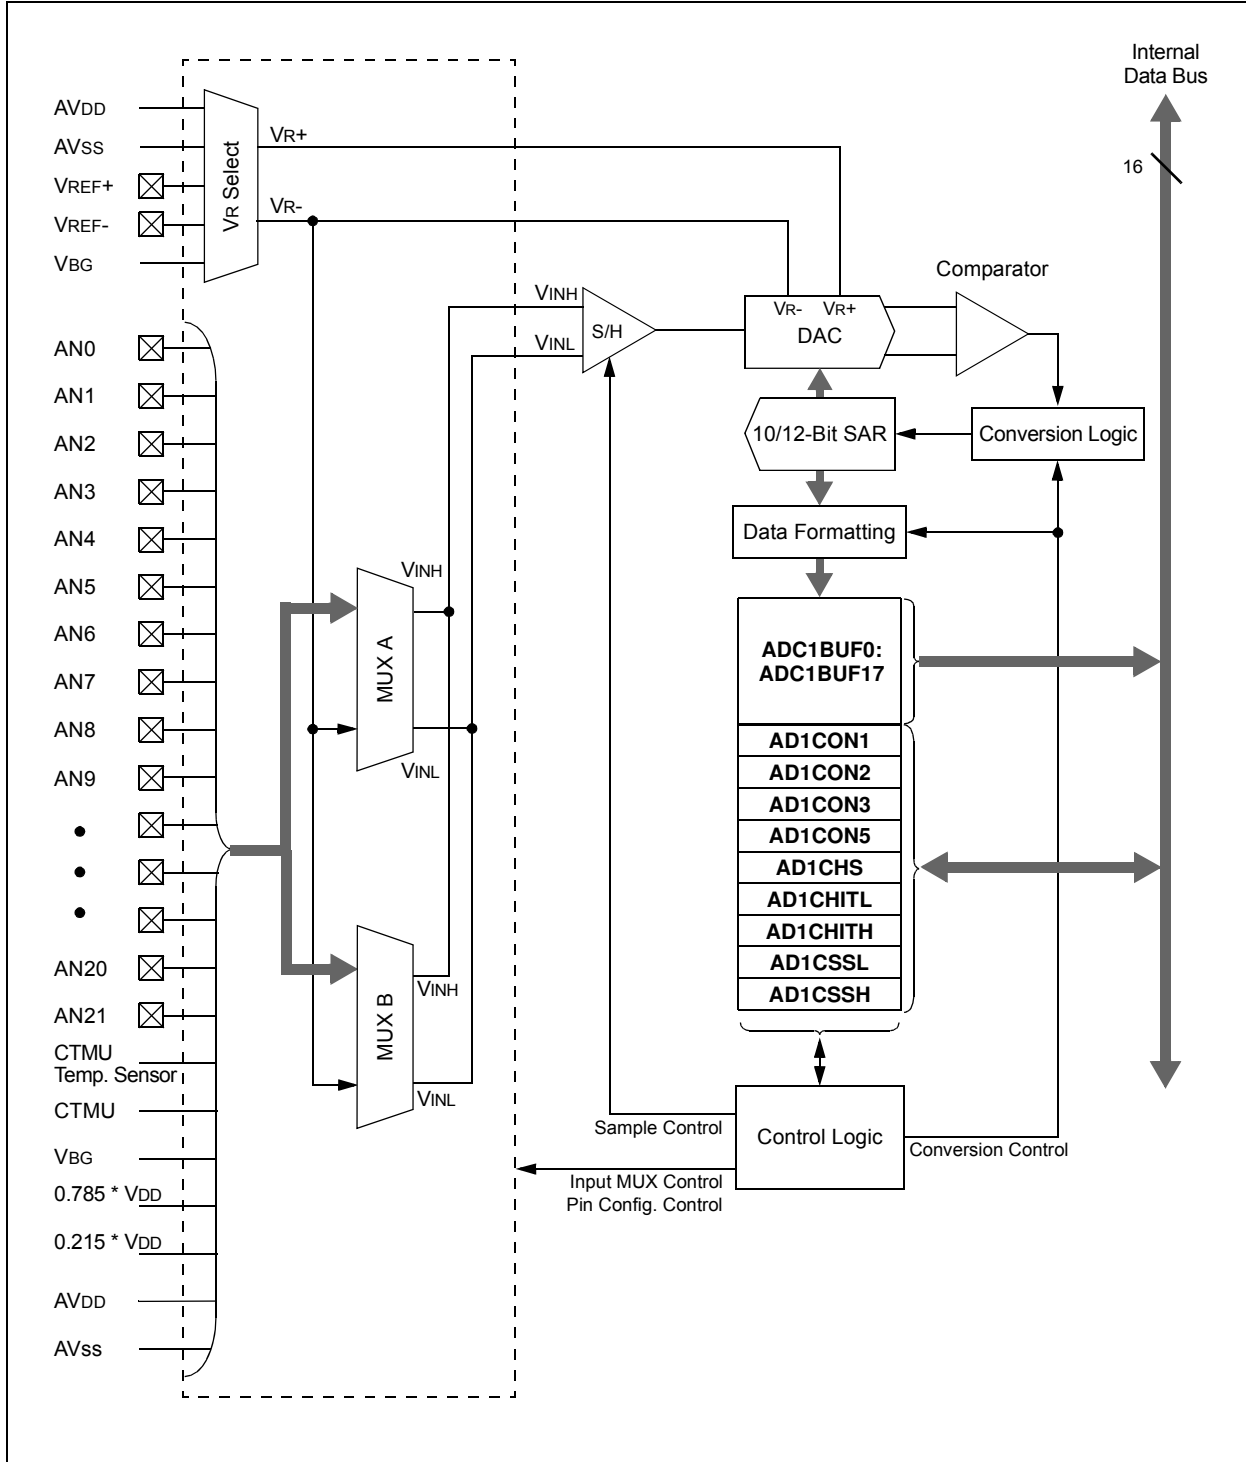

To perform an A/D conversion:

1. Configure the A/D module:
   a) Configure the port pins as analog inputs and/or select band gap reference inputs (ANSx registers).
   b) Select the voltage reference source to match the expected range on the analog inputs (AD1CON2<15:13>).
   c) Select the analog conversion clock to match the desired data rate with the processor clock (AD1CON3<7:0>).
   d) Select the appropriate sample/conversion sequence (AD1CON1<7:4> and AD1CON3<12:8>).
   e) Configure the MODE12 bit to select A/D resolution (AD1CON1<10>).
   f) Select how conversion results are presented in the buffer (AD1CON1<9:8>).
   g) Select the interrupt rate (AD1CON2<6:2>).
   h) Turn on the A/D module (AD1CON1<15>).

2. Configure the A/D interrupt (if required):
   a) Clear the AD1IF bit.
   b) Select the A/D interrupt priority.

To perform an A/D sample and conversion using Threshold Detect scanning:

1. Configure the A/D module:
   a) Configure the port pins as analog inputs (ANSx registers).
   b) Select the voltage reference source to match the expected range on the analog inputs (AD1CON2<15:13>).
   c) Select the analog conversion clock to match the desired data rate with the processor clock (AD1CON3<7:0>).
   d) Select the appropriate sample/conversion sequence (AD1CON1<7:4> and AD1CON3<12:8>).
   e) Configure the MODE12 bit to select A/D resolution (AD1CON1<10>).
   f) Select how the conversion results are presented in the buffer (AD1CON1<9:8>).
   g) Select the interrupt rate (AD1CON2<6:2>).

2. Configure the threshold compare channels:
   a) Enable auto-scan; set the ASEN bit (AD1CON5<15>).
   b) Select the Compare mode, "Greater Than, Less Than or Windowed"; set the CMx bits (AD1CON5<1:0>).
   c) Select the threshold compare channels to be scanned (AD1CSSH, AD1CSSL).
   d) If the CTMU is required as a current source for a threshold compare channel, enable the corresponding CTMU channel (AD1CTMENH, AD1CTMENL).
   e) Write the threshold values into the corresponding ADC1BUFx registers.
   f) Turn on the A/D module (AD1CON1<15>).

> **Note:** If performing an A/D sample and conversion, using Threshold Detect in Sleep Mode, the RC A/D clock source must be selected before entering into Sleep mode.

3. Configure the A/D interrupt (OPTIONAL):
   a) Clear the AD1IF bit.
   b) Select the A/D interrupt priority.

## 19.1 A/D Control Registers

The 12-bit A/D Converter module uses up to 43 registers for its operation. All registers are mapped in the data memory space.

### 19.1.1 CONTROL REGISTERS

Depending on the specific device, the module has up to eleven control and status registers:

- AD1CON1: A/D Control Register 1
- AD1CON2: A/D Control Register 2
- AD1CON3: A/D Control Register 3
- AD1CON5: A/D Control Register 5
- AD1CHS: A/D Sample Select Register
- AD1CHITH and AD1CHITL: A/D Scan Compare Hit Registers
- AD1CSSH and AD1CSSL: A/D Input Scan Select Registers
- AD1CTMENH and AD1CTMENL: CTMU Enable Registers

The AD1CON1, AD1CON2 and AD1CON3 registers (Register 19-1, Register 19-2 and Register 19-3) control the overall operation of the A/D module. This includes enabling the module, configuring the conversion clock and voltage reference sources, selecting the sampling and conversion Triggers, and manually controlling the sample/convert sequences. The AD1CON5 register (Register 19-4) specifically controls features of the Threshold Detect operation, including its function in power-saving modes.

The AD1CHS register (Register 19-5) selects the input channels to be connected to the S/H amplifier. It also allows the choice of input multiplexers and the selection of a reference source for differential sampling.

The AD1CHITH and AD1CHITL registers (Register 19-6 and Register 19-7) are semaphore registers used with Threshold Detect operations. The status of individual bits, or bit pairs in some cases, indicates if a match condition has occurred. AD1CHITL is always implemented, whereas AD1CHITH may not be implemented in devices with 16 or fewer channels.

The AD1CSSH/L registers (Register 19-8 and Register 19-9) select the channels to be included for sequential scanning.

The AD1CTMENH/L registers (Register 19-10 and Register 19-11) select the channel(s) to be used by the CTMU during conversions. Selecting a particular channel allows the A/D Converter to control the CTMU (particularly, its current source) and read its data through that channel. AD1CTMENL is always implemented, whereas AD1CTMENH may not be implemented in devices with 16 or fewer channels.

### 19.1.2 A/D RESULT BUFFERS

The module incorporates a multi-word, dual port buffer, called ADC1BUFx. Each of the locations is mapped into the data memory space and is separately addressable. The buffer locations are referred to as ADC1BUF0 through ADC1BUFx (x = up to 17).

The A/D result buffers are both readable and writable. When the module is active (AD1CON<15> = 1), the buffers are read-only and store the results of A/D conversions. When the module is inactive (AD1CON<15> = 0), the buffers are both readable and writable. In this state, writing to a buffer location programs a conversion threshold for Threshold Detect operations.

Buffer contents are not cleared when the module is deactivated with the ADON bit (AD1CON1<15>). Conversion results and any programmed threshold values are maintained when ADON is set or cleared.

bit 9-8 **Unimplemented:** Read as '0'

bit 7 **BUFS:** A/D Buffer Fill Status bit[1]
1 = A/D is filling the upper half of the buffer; user should access data in the lower half
0 = A/D is filling the lower half of the buffer; user should access data in the upper half

bit 6-2 **SMPI<4:0>:** Interrupt Sample Rate Select bits
11111 = Interrupts at the completion of the conversion for each 32nd sample
11110 = Interrupts at the completion of the conversion for each 31st sample
•
•
•
00001 = Interrupts at the completion of the conversion for every other sample
00000 = Interrupts at the completion of the conversion for each sample

bit 1 **BUFM:** A/D Buffer Fill Mode Select bit[1]
1 = Starts filling the buffer at address, ADC1BUF0, on the first interrupt and ADC1BUF(x/2) on the next interrupt (Split Buffer mode)
0 = Starts filling the buffer at address, ADC1BUF0, and each sequential address on successive interrupts (FIFO mode)

bit 0 **ALTS:** Alternate Input Sample Mode Select bit
1 = Uses channel input selects for Sample A on the first sample and Sample B on the next sample
0 = Always uses channel input selects for Sample A

**Note 1:** This is only applicable when the buffer is used in FIFO mode (BUFREGEN = 0). In addition, BUFS is only used when BUFM = 1.
    **2:** PIC24FV16KMXXX devices only. Reference setting will not be within specification for VDD below 4.5V.
    **3:** Reference setting will not be within specification for VDD below 2.3V.

bit 9-8 **ASINT<1:0>:** Auto-Scan (Threshold Detect) Interrupt Mode bits

$11$ = Interrupt after a Threshold Detect sequence has completed and a valid compare has occurred
$10$ = Interrupt after a valid compare has occurred
$01$ = Interrupt after a Threshold Detect sequence has completed
$00$ = No interrupt

bit 7-4 **Unimplemented:** Read as '0'

bit 3-2 **WM<1:0>:** A/D Write Mode bits

$11$ = Reserved
$10$ = Auto-compare only (conversion results are not saved, but interrupts are generated when a valid match, as defined by the CMx and ASINTx bits, occurs)
$01$ = Convert and save (conversion results are saved to locations as determined by the register bits when a match, as defined by the CMx bits, occurs)
$00$ = Legacy operation (conversion data is saved to a location determined by the buffer register bits)

bit 1-0 **CM<1:0>:** A/D Compare Mode bits

$11$ = Outside Window mode (valid match occurs if the conversion result is outside of the window defined by the corresponding buffer pair)
$10$ = Inside Window mode (valid match occurs if the conversion result is inside the window defined by the corresponding buffer pair)
$01$ = Greater Than mode (valid match occurs if the result is greater than the value in the corresponding buffer register)
$00$ = Less Than mode (valid match occurs if the result is less than the value in the corresponding buffer register)

**Note 1:** When using auto-scan with Threshold Detect (ASEN = $1$), do not configure the sample clock source to Auto-Convert mode (SSRC<3:0> = 7). Any other available SSRC selection is valid. To use auto-convert as the sample clock source (SSRC<3:0> = 7), make sure ASEN is cleared.

## 19.2 A/D Sampling Requirements

The analog input model of the 12-bit A/D Converter is shown in Figure 19-2. The total sampling time for the A/D is a function of the holding capacitor charge time.

For the A/D Converter to meet its specified accuracy, the Charge Holding Capacitor ($C_{HOLD}$) must be allowed to fully charge to the voltage level on the analog input pin. The Source Impedance ($R_S$), the Interconnect Impedance ($R_{IC}$) and the Internal Sampling Switch Impedance ($R_{SS}$) combine to directly affect the time required to charge $C_{HOLD}$. The combined impedance of the analog sources must, therefore, be small enough to fully charge the holding capacitor within the chosen sample time. To minimize the effects of pin leakage currents on the accuracy of the A/D Converter, the maximum recommended source impedance, $R_S$, is 2.5 kΩ. After the analog input channel is selected (changed), this sampling function must be completed prior to starting the conversion. The internal holding capacitor will be in a discharged state prior to each sample operation.

At least 1 $T_{AD}$ time period should be allowed between conversions for the sample time. For more details, see **Section 27.0 "Electrical Characteristics"**.

**EQUATION 19-1:  A/D CONVERSION CLOCK PERIOD**

$$T_{AD} = T_{CY} (ADCS + 1)$$

$$ADCS = \frac{T_{AD}}{T_{CY}} - 1$$

**Note:** Based on $T_{CY}$ = 2/$F_{OSC}$; Doze mode and PLL are disabled.

**FIGURE 19-2:  12-BIT A/D CONVERTER ANALOG INPUT MODEL**

Legend:
- $C_{PIN}$ = Input Capacitance
- $V_T$ = Threshold Voltage
- $I_{LEAKAGE}$ = Leakage Current at the Pin Due to Various Junctions
- $R_{IC}$ = Interconnect Resistance
- $R_{SS}$ = Sampling Switch Resistance
- $C_{HOLD}$ = Sample-and-Hold Capacitance (from DAC)

**Note:** The $C_{PIN}$ value depends on the device package and is not tested. The effect of $C_{PIN}$ is negligible if $R_S \leq 5$ kΩ.
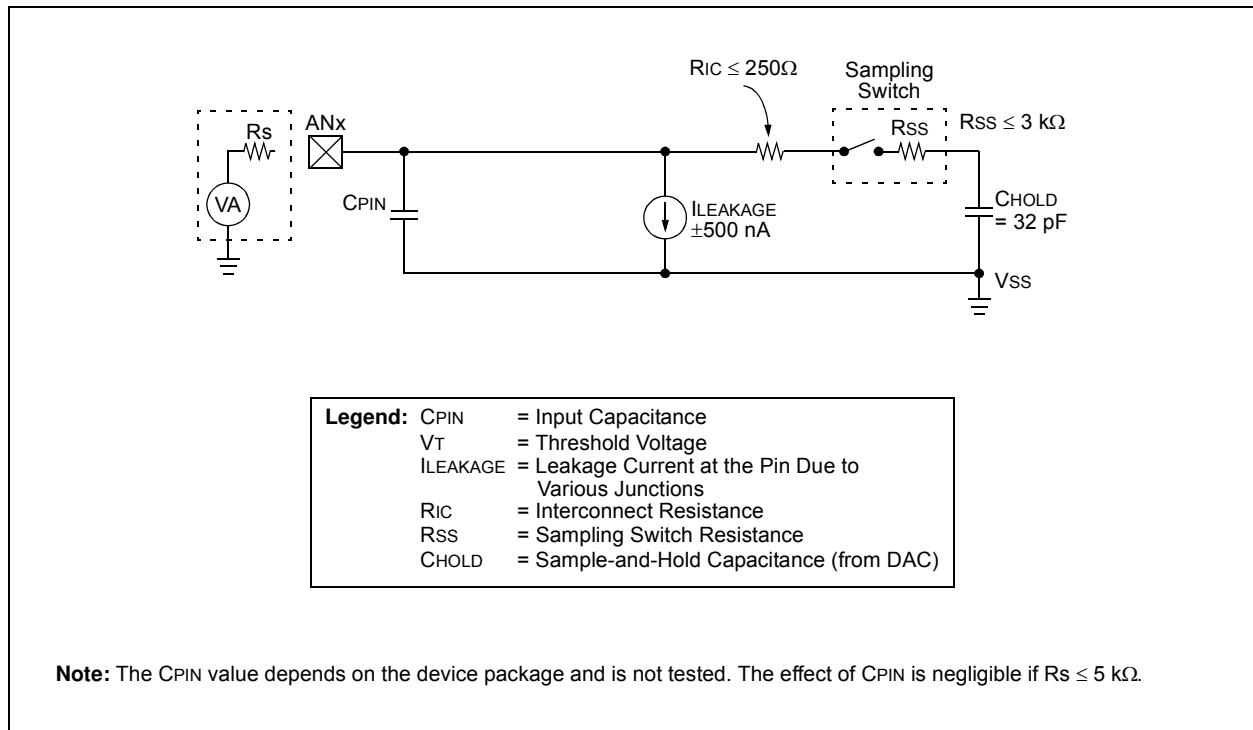

## 19.3 Transfer Function

The transfer functions of the A/D Converter in 12-bit resolution are shown in Figure 19-3. The difference of the input voltages ($V_{INH} - V_{INL}$) is compared to the reference (($V_{R+}$) – ($V_{R-}$)).

• The first code transition occurs when the input voltage is (($V_{R+}$) – ($V_{R-}$))/4096 or 1.0 LSb.

• The '0000 0000 0001' code is centered at $V_{R-}$ + (1.5 * (($V_{R+}$) – ($V_{R-}$))/4096).

• The '0010 0000 0000' code is centered at $V_{REFL}$ + (2048.5 * (($V_{R+}$) – ($V_{R-}$))/4096).

• An input voltage less than $V_{R-}$ + ((($V_{R-}$) – ($V_{R-}$))/4096) converts as '0000 0000 0000'.

• An input voltage greater than ($V_{R-}$) + (4095 (($V_{R+}$) – ($V_{R-}$))/4096) converts as '1111 1111 1111'.

**FIGURE 19-3:** **12-BIT A/D TRANSFER FUNCTION**
## 19.4 Buffer Data Formats

The A/D conversions are fully differential 12-bit values when MODE12 = 1 (AD1CON1<10>) and 10-bit values when MODE12 = 0. When absolute fractional or absolute integer formats are used, the results are 12 or 10 bits wide, respectively. When signed decimal formatting is used, the conversion also includes a Sign bit, making 12-bit conversions 13 bits wide and 10-bit conversions 11 bits wide. The signed decimal format yields 12-bit and 10-bit values, respectively. The Sign bit (bit 12 or bit 10) is sign-extended to fill the buffer. The FORM<1:0> bits (AD1CON1<9:8>) select the format. Figure 19-4 and Figure 19-5 show the data output formats that can be selected. Table 19-1 through Table 19-4 show the numerical equivalents for the various conversion result codes.

**NOTES:**

## 20.0 8-BIT DIGITAL-TO-ANALOG CONVERTER (DAC)

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"PIC24F Family Reference Manual"*. Device-specific information in this data sheet supersedes the information in the *"PIC24F Family Reference Manual"*.

PIC24FV16KM204 family devices include two 8-bit Digital-to-Analog Converters (DACs) for generating analog outputs from digital data. A simplified block diagram for a single DAC is shown in Figure 20-1. Both of the DACs are identical.

The DAC generates an analog output voltage based on the digital input code, according to the formula:

$$V\text{DAC} = \frac{V\text{DACREF} \times \text{DACxDAT}}{256}$$

where $V\text{DAC}$ is the analog output voltage and $V\text{DACREF}$ is the reference voltage selected by DACREF<1:0>.

Each DAC includes these features:

- Precision 8-bit resistor ladder for high accuracy
- Fast settling time, supporting 1 Msps effective sampling rates
- Buffered output voltage
- Three user-selectable voltage reference options
- Multiple conversion Trigger options, plus a manual convert-on-write option
- Left and right justified input data options
- User-selectable Sleep and Idle mode operation

When using the DAC, it is recommended to set the ANSx and TRISx bits for the DACx output pin to configure it as an analog output. See **Section 11.2 "Configuring Analog Port Pins"** for more information.

## 21.0 DUAL OPERATIONAL AMPLIFIER MODULE

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"PIC24F Family Reference Manual"*, **"Operational Amplifier (Op Amp)"** (DS30505). Device-specific information in this data sheet supersedes the information in the *"PIC24F Family Reference Manual"*.

PIC24FV16KM204 family devices include two operational amplifiers to complement the microcontroller's other analog features. They may be used to provide analog signal conditioning, either as stand-alone devices or in addition to other analog peripherals.

The two op amps are functionally identical; the block diagram for a single amplifier is shown in Figure 21-1. Each op amp has these features:

- Internal unity-gain buffer option
- Multiple input options each on the inverting and non-inverting amplifier inputs
- Rail-to-rail input and output capabilities
- User-selectable option for regular or low-power operation
- User-selectable operation in Idle and Sleep modes

When using the op amps, it is recommended to set the ANSx and TRISx bits of both the input and output pins to configure them as analog pins. See **Section 11.2 "Configuring Analog Port Pins"** for more information.

**Note 1:** This register is available only on PIC24F(V)16KM2XX devices.

## 22.0 COMPARATOR MODULE

> **Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Comparator module, refer to the *"PIC24F Family Reference Manual"*, **"Scalable Comparator Module"** (DS39734).

The comparator module provides three dual input comparators. The inputs to the comparator can be configured to use any one of four external analog inputs, as well as a voltage reference input from either the Internal Band Gap Buffer 1 (BGBUF1) or the comparator voltage reference generator.

The comparator outputs may be directly connected to the CxOUT pins. When the respective COE bit equals '1', the I/O pad logic makes the unsynchronized output of the comparator available on the pin.

A simplified block diagram of the module is shown in Figure 22-1. Diagrams of the possible individual comparator configurations are shown in Figure 22-2.

Each comparator has its own control register, CMxCON (Register 22-1), for enabling and configuring its operation. The output and event status of all three comparators is provided in the CMSTAT register (Register 22-2).

**FIGURE 22-1:** **COMPARATOR x MODULE BLOCK DIAGRAM**

| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared          x = Bit is unknown |

bit 15    **CON:** Comparator x Enable bit

    1 =  Comparator is enabled
    0 =  Comparator is disabled

bit 14    **COE:** Comparator x Output Enable bit

    1 =  Comparator output is present on the CxOUT pin
    0 =  Comparator output is internal only

bit 13    **CPOL:** Comparator x Output Polarity Select bit

    1 =  Comparator output is inverted
    0 =  Comparator output is not inverted

bit 12    **CLPWR:** Comparator x Low-Power Mode Select bit

    1 = Comparator operates in Low-Power mode
    0 = Comparator does not operate in Low-Power mode

bit 11-10    **Unimplemented:** Read as '0'

bit 9    **CEVT:** Comparator x Event bit

    1 =  Comparator event, defined by EVPOL<1:0>, has occurred; subsequent Triggers and interrupts are
        disabled until the bit is cleared
    0 =  Comparator event has not occurred

bit 8    **COUT:** Comparator x Output bit

    When CPOL = 0:
    1 =  $V_{IN}+ > V_{IN}-$
    0 =  $V_{IN}+ < V_{IN}-$
    When CPOL = 1:
    1 =  $V_{IN}+ < V_{IN}-$
    0 =  $V_{IN}+ > V_{IN}-$

bit 7-6    **EVPOL<1:0>:** Trigger/Event/Interrupt Polarity Select bits[2]

    11 = Trigger/event/interrupt is generated on any change of the comparator output (while CEVT = 0)
    10 = Trigger/event/interrupt is generated on the high-to-low transition of the comparator output
    01 = Trigger/event/interrupt is generated on the low-to-high transition of the comparator output
    00 = Trigger/event/interrupt generation is disabled

bit 5    **Unimplemented:** Read as '0'

bit 4-3    **CREF<1:0>:** Comparator x Reference Select bits (non-inverting input)

    11 = Non-inverting input connects to the DAC2 output
    10 = Non-inverting input connects to the DAC1 output
    01 = Non-inverting input connects to the internal CVREF voltage
    00 = Non-inverting input connects to the CxINA pin

**Note 1:**    BGBUF1 voltage is configured by BUFREF1<1:0> (BUFCON0<1:0>).
    **2:**    If the EVPOL<1:0> bits are set to a value other than '00', the first interrupt generated will occur on any
        transition of COUT. Subsequent interrupts will occur based on the EVPOLx bits setting.

**REGISTER 22-1: CMxCON: COMPARATOR x CONTROL REGISTERS (CONTINUED)**

bit 2        **Unimplemented:** Read as '0'

bit 1-0      **CCH<1:0>:** Comparator x Channel Select bits

11 = Inverting input of the comparator connects to BGBUF1[1]
10 = Inverting input of the comparator connects to the CxIND pin
01 = Inverting input of the comparator connects to the CxINC pin
00 = Inverting input of the comparator connects to the CxINB pin

**Note 1:** BGBUF1 voltage is configured by BUFREF1<1:0> (BUFCON0<1:0>).

**2:** If the EVPOL<1:0> bits are set to a value other than '00', the first interrupt generated will occur on any transition of COUT. Subsequent interrupts will occur based on the EVPOLx bits setting.

Shows the current output of Comparator 1 (CM1CON<8>).

**Note 1:** Comparator 2 and Comparator 3 are only available on PIC24F(V)16KM2XX devices.

## 23.0 COMPARATOR VOLTAGE REFERENCE

| Note: | This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Comparator Voltage Reference, refer to the *"PIC24F Family Reference Manual"*, **"Comparator Voltage Reference Module"** (DS39709). |
|---|---|

## 23.1 Configuring the Comparator Voltage Reference

The comparator voltage reference module is controlled through the CVRCON register (Register 23-1). The comparator voltage reference provides a range of output voltages with 32 distinct levels.

The comparator voltage reference supply voltage can come from either $V_{DD}$ and $V_{SS}$, or the external $V_{REF}+$ and $V_{REF}-$. The voltage source is selected by the CVRSS bit (CVRCON<5>).

The settling time of the comparator voltage reference must be considered when changing the $CV_{REF}$ output.

<u>When CVRSS = 0:</u>
$CV_{REF} = (AV_{SS}) + (CVR<4:0>/32) \cdot (AV_{DD} - AV_{SS})$

## 24.0 CHARGE TIME MEASUREMENT UNIT (CTMU)

**Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Charge Time Measurement Unit, refer to the *"PIC24F Family Reference Manual"*, **"Charge Time Measurement Unit (CTMU) with Threshold Detect"** (DS39743).

The Charge Time Measurement Unit (CTMU) is a flexible analog module that provides charge measurement, accurate differential time measurement between pulse sources and asynchronous pulse generation. Its key features include:

• Thirteen external edge input Trigger sources
• Polarity control for each edge source
• Control of edge sequence
• Control of response to edge levels or edge transitions
• Time measurement resolution of one nanosecond
• Accurate current source suitable for capacitive measurement

Together with other on-chip analog modules, the CTMU can be used to precisely measure time, measure capacitance, measure relative changes in capacitance or generate output pulses that are independent of the system clock. The CTMU module is ideal for interfacing with capacitive-based touch sensors.

The CTMU is controlled through three registers: CTMUCON1, CTMUCON2 and CTMUICON. CTMUCON1 enables the module and controls the mode of operation of the CTMU, as well as controlling edge sequencing. CTMUCON2 controls edge source selection and edge source polarity selection. The CTMUICON register selects the current range of current source and trims the current.

### 24.1 Measuring Capacitance

The CTMU module measures capacitance by generating an output pulse, with a width equal to the time between edge events, on two separate input channels. The pulse edge events to both input channels can be selected from several internal peripheral modules (OC1, Timer1, any input capture or comparator module) and up to 13 external pins (CTED1 through CTED13). This pulse is used with the module's precision current source to calculate capacitance according to the relationship:

**EQUATION 24-1:**

$$I = C \cdot \frac{dV}{dT}$$

For capacitance measurements, the A/D Converter samples an External Capacitor ($C_{APP}$) on one of its input channels after the CTMU output's pulse. A Precision Resistor ($R_{PR}$) provides current source calibration on a second A/D channel. After the pulse ends, the converter determines the voltage on the capacitor. The actual calculation of capacitance is performed in software by the application.

Figure 24-1 illustrates the external connections used for capacitance measurements, and how the CTMU and A/D modules are related in this application. This example also shows the edge events coming from Timer1, but other configurations using external edge sources are possible. A detailed discussion on measuring capacitance and time with the CTMU module is provided in the "*PIC24F Family Reference Manual*".

**FIGURE 24-1:** **TYPICAL CONNECTIONS AND INTERNAL CONFIGURATION FOR CAPACITANCE MEASUREMENT**

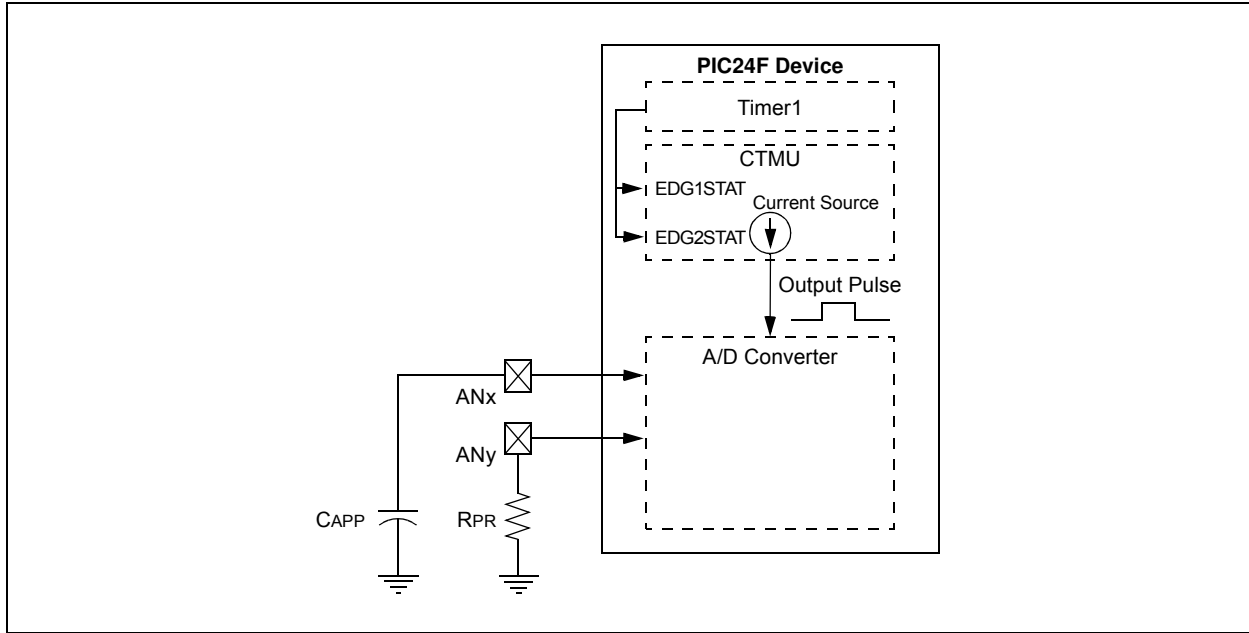

## 24.2 Measuring Time

Time measurements on the pulse width can be similarly performed using the A/D module's Internal Capacitor ($C_{AD}$) and a precision resistor for current calibration. Figure 24-2 displays the external connections used for time measurements, and how the CTMU and A/D modules are related in this application. This example also shows both edge events coming from the external CTEDx pins, but other configurations using internal edge sources are possible.

**FIGURE 24-2:** **TYPICAL CONNECTIONS AND INTERNAL CONFIGURATION FOR TIME MEASUREMENT**
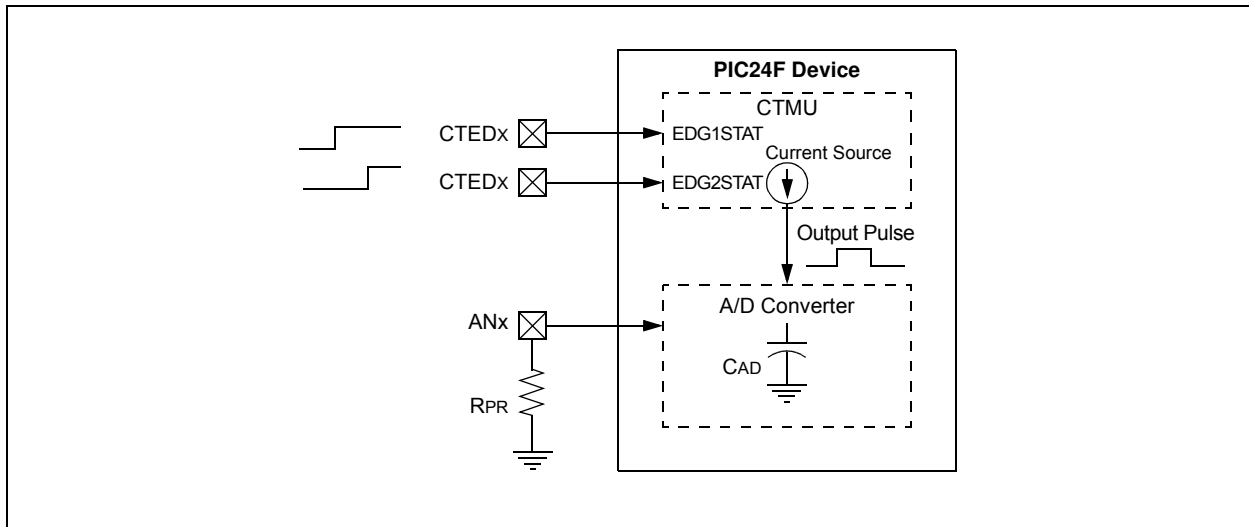

## 24.3 Pulse Generation and Delay

The CTMU module can also generate an output pulse with edges that are not synchronous with the device's system clock. More specifically, it can generate a pulse with a programmable delay from an edge event input to the module.

When the module is configured for pulse generation delay by setting the TGEN bit (CTMUCON1L<12>), the internal current source is connected to the B input of Comparator 2. A Capacitor (CDELAY) is connected to the Comparator 2 pin, C2INB, and the Comparator Voltage Reference, CVREF, is connected to C2INA. CVREF is then configured for a specific trip point. The module begins to charge CDELAY when an edge event is detected. While CVREF is greater than the voltage on CDELAY, the CTPLS pin is high.

When the voltage on CDELAY equals CVREF, CTPLS goes low. With Comparator 2 configured as the second edge, this stops the CTMU from charging. In this state event, the CTMU automatically connects to ground. The IDISSEN bit doesn't need to be set and cleared before the next CTPLS cycle.

Figure 24-3 illustrates the external connections for pulse generation, as well as the relationship of the different analog modules required. While CTED1 is shown as the input pulse source, other options are available. A detailed discussion on pulse generation with the CTMU module is provided in the "*PIC24F Family Reference Manual*".

## 25.0 SPECIAL FEATURES

**Note:** This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Watchdog Timer, High-Level Device Integration and Programming Diagnostics, refer to the individual sections of the *"PIC24F Family Reference Manual"* provided below:

• **"Watchdog Timer (WDT)"** (DS39697)
• **"Programming and Diagnostics"** (DS39716)

PIC24FXXXXX family devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

• Flexible Configuration
• Watchdog Timer (WDT)
• Code Protection
• In-Circuit Serial Programming™ (ICSP™)
• In-Circuit Emulation

## 25.1 Configuration Bits

The Configuration bits can be programmed (read as '0') or left unprogrammed (read as '1') to select various device configurations. These bits are mapped, starting at program memory location, F80000h. A complete list of Configuration register locations is provided in Table 25-1. A detailed explanation of the various bit functions is provided in Register 25-1 through Register 25-9.

The address, F80000h, is beyond the user program memory space. In fact, it belongs to the configuration memory space (800000h-FFFFFFh), which can only be accessed using Table Reads and Table Writes.

**TABLE 25-1: CONFIGURATION REGISTERS LOCATIONS**

## 25.2    On-Chip Voltage Regulator

All of the PIC24FXXXXX family devices power their core digital logic at a nominal 3.0V. This may create an issue for designs that are required to operate at a higher typical voltage, as high as 5.0V. To simplify system design, all devices in the "FV" family incorporate an on-chip regulator that allows the device core to run at 3.0V, while the I/O is powered by V$_{DD}$ at a higher voltage.

The regulator is always enabled and provides power to the core from the other V$_{DD}$ pins. A low-ESR capacitor (such as ceramic) must be connected to the V$_{CAP}$ pin (Figure 25-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor is provided in **Section 27.1 "DC Characteristics"** and discussed in detail in **Section 2.0 "Guidelines for Getting Started with 16-Bit Microcontrollers"**.

In all of the "F" family of devices, the regulator is disabled. Instead, the core logic is directly powered from V$_{DD}$. "F" devices operate at a lower range of V$_{DD}$ voltage, from 1.8V-3.6V.

### 25.2.1    VOLTAGE REGULATOR TRACKING MODE AND LOW-VOLTAGE DETECTION

For all PIC24FXXXXX devices, the on-chip regulator provides a constant voltage of 3.0V nominal to the digital core logic. The regulator can provide this level from a V$_{DD}$ of about 3.2V, all the way up to the device's V$_{DDMAX}$. It does not have the capability to boost V$_{DD}$ levels below 3.2V. In order to prevent "brown out" conditions when the voltage drops too low for the regulator, the regulator enters Tracking mode. In Tracking mode, the regulator output follows V$_{DD}$ with a typical voltage drop of 150 mV.

When the device enters Tracking mode, it is no longer possible to operate at full speed. To provide information about when the device enters Tracking mode, the on-chip High/Low-Voltage Detect (HLVD) module can be used. The HLVD trip point should be configured so that if V$_{DD}$ drops close to the minimum voltage for the operating frequency of the device, the HLVD Interrupt Flag, HLVDIF (IFS4<8>), will occur. This can be used to generate an interrupt and put the application into a low-power operational mode or trigger an orderly shutdown. Refer to **Section 27.1 "DC Characteristics"** for the specifications detailing the maximum operating speed based on the applied V$_{DD}$ voltage.

**FIGURE 25-1:    CONNECTIONS FOR THE ON-CHIP VOLTAGE REGULATOR**

**Note 1:**    These are typical operating voltages. Refer to **Section 27.0 "Electrical Characteristics"** for the full operating ranges of V$_{DD}$ and V$_{DDCORE}$.
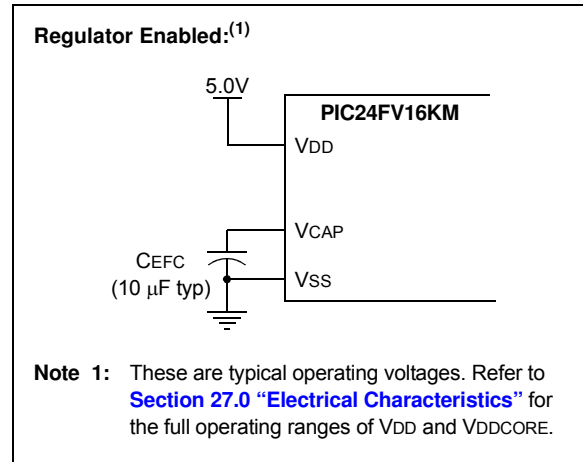

### 25.2.2    VOLTAGE REGULATOR START-UP TIME

For PIC24FXXXXX family devices, it takes a short time, designated as T$_{PM}$, for the regulator to generate a stable output. During this time, code execution is disabled. T$_{PM}$ is applied every time the device resumes operation after any power-down, including Sleep mode. T$_{PM}$ is specified in **Section 27.2 "AC Characteristics and Timing Parameters"**.

## 25.3    Watchdog Timer (WDT)

For the PIC24FXXXXX family of devices, the WDT is driven by the LPRC Oscillator. When the WDT is enabled, the clock source is also enabled.

The nominal WDT clock source from LPRC is 31 kHz. This feeds a prescaler that can be configured for either 5-bit (divide-by-32) or 7-bit (divide-by-128) operation. The prescaler is set by the FWPSA Configuration bit. With a 31 kHz input, the prescaler yields a nominal WDT Time-out period (T$_{WDT}$) of 1 ms in 5-bit mode or 4 ms in 7-bit mode.

A variable postscaler divides down the WDT prescaler output and allows for a wide range of time-out periods. The postscaler is controlled by the Configuration bits, WDTPS<3:0> (FWDT<3:0>), which allow the selection of a total of 16 settings, from 1:1 to 1:32,768. Using the prescaler and postscaler time-out periods, ranges from 1 ms to 131 seconds can be achieved.

The WDT, prescaler and postscaler are reset:

- On any device Reset
- On the completion of a clock switch, whether invoked by software (i.e., setting the OSWEN bit after changing the NOSCx bits) or by hardware (i.e., Fail-Safe Clock Monitor)
- When a PWRSAV instruction is executed (i.e., Sleep or Idle mode is entered)
- When the device exits Sleep or Idle mode to resume normal operation
- By a CLRWDT instruction during normal execution

If the WDT is enabled in hardware (FWDTEN<1:0> = 11), it will continue to run during Sleep or Idle modes. When the WDT time-out occurs, the device will wake and code execution will continue from where the PWRSAV instruction was executed. The corresponding SLEEP or IDLE bit (RCON<3:2>) will need to be cleared in software after the device wakes up.

The WDT Flag bit, WDTO (RCON<4>), is not automatically cleared following a WDT time-out. To detect subsequent WDT events, the flag must be cleared in software.

> **Note:** The CLRWDT and PWRSAV instructions clear the prescaler and postscaler counts when executed.

### 25.3.1 WINDOWED OPERATION

The Watchdog Timer has an optional Fixed Window mode of operation. In this Windowed mode, CLRWDT instructions can only reset the WDT during the last 1/4 of the programmed WDT period. A CLRWDT instruction executed before that window causes a WDT Reset, similar to a WDT time-out.

Windowed WDT mode is enabled by programming the Configuration bit, WINDIS (FWDT<6>), to '0'.

### 25.3.2 CONTROL REGISTER

The WDT is enabled or disabled by the FWDTEN<1:0> Configuration bits. When both of the FWDTEN<1:0> Configuration bits are set, the WDT is always enabled.

The WDT can be optionally controlled in software when the FWDTEN<1:0> Configuration bits have been programmed to '10'. The WDT is enabled in software by setting the SWDTEN control bit (RCON<5>). The SWDTEN control bit is cleared on any device Reset. The software WDT option allows the user to enable the WDT for critical code segments, and disable the WDT during non-critical segments, for maximum power savings. When the FWDTEN<1:0> bits are set to '01', the WDT is only enabled in Run and Idle modes, and is disabled in Sleep. Software control of the SWDTEN bit (RCON<5>) is disabled with this setting.

**FIGURE 25-2: WDT BLOCK DIAGRAM**
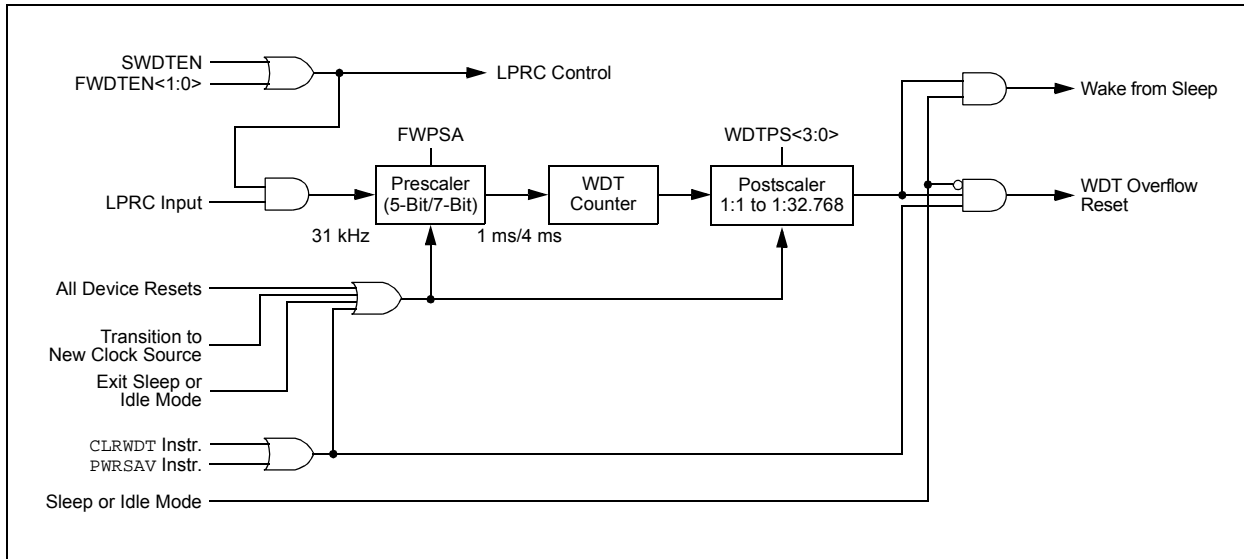

## 25.4 Program Verification and Code Protection

For all devices in the PIC24FXXXXX family, code protection for the Boot Segment is controlled by the Configuration bit, BSS0, and the General Segment by the Configuration bit, GCP. These bits inhibit external reads and writes to the program memory space This has no direct effect in normal execution mode.

Write protection is controlled by bit, BWRP, for the Boot Segment and bit, GWRP, for the General Segment in the Configuration Word. When these bits are programmed to '0', internal write and erase operations to program memory are blocked.

## 25.5 In-Circuit Serial Programming

PIC24FXXXXX family microcontrollers can be serially programmed while in the end application circuit. This is simply done with two lines for clock (PGECx) and data (PGEDx), and three other lines for power, ground and the programming voltage. This allows customers to manufacture boards with unprogrammed devices and then program the microcontroller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

## 25.6 In-Circuit Debugger

When MPLAB® ICD 3, MPLAB REAL ICE™ or PICkit™ 3 is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGECx and PGEDx pins.

To use the in-circuit debugger function of the device, the design must implement ICSP connections to $\overline{MCLR}$, $V_{DD}$, $V_{SS}$, PGECx, PGEDx and the pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins.

**NOTES:**

## 26.0    DEVELOPMENT SUPPORT

The PIC® microcontrollers (MCU) and dsPIC® digital signal controllers (DSC) are supported with a full range of software and hardware development tools:

- Integrated Development Environment
  - MPLAB® X IDE Software
- Compilers/Assemblers/Linkers
  - MPLAB XC Compiler
  - MPASM™ Assembler
  - MPLINK™ Object Linker/
    MPLIB™ Object Librarian
  - MPLAB Assembler/Linker/Librarian for Various Device Families
- Simulators
  - MPLAB X SIM Software Simulator
- Emulators
  - MPLAB REAL ICE™ In-Circuit Emulator
- In-Circuit Debuggers/Programmers
  - MPLAB ICD 3
  - PICkit™ 3
- Device Programmers
  - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards, Evaluation Kits and Starter Kits
- Third-party development tools

## 26.1    MPLAB X Integrated Development Environment Software

The MPLAB X IDE is a single, unified graphical user interface for Microchip and third-party software, and hardware development tool that runs on Windows®, Linux and Mac OS® X. Based on the NetBeans IDE, MPLAB X IDE is an entirely new IDE with a host of free software components and plug-ins for high-performance application development and debugging. Moving between tools and upgrading from software simulators to hardware debugging and programming tools is simple with the seamless user interface.

With complete project management, visual call graphs, a configurable watch window and a feature-rich editor that includes code completion and context menus, MPLAB X IDE is flexible and friendly enough for new users. With the ability to support multiple tools on multiple projects with simultaneous debugging, MPLAB X IDE is also suitable for the needs of experienced users.

Feature-Rich Editor:

- Color syntax highlighting
- Smart code completion makes suggestions and provides hints as you type
- Automatic code formatting based on user-defined rules
- Live parsing

User-Friendly, Customizable Interface:

- Fully customizable interface: toolbars, toolbar buttons, windows, window placement, etc.
- Call graph window

Project-Based Workspaces:

- Multiple projects
- Multiple tools
- Multiple configurations
- Simultaneous debugging sessions

File History and Bug Tracking:

- Local file history feature
- Built-in support for Bugzilla issue tracker

## 26.2 MPLAB XC Compilers

The MPLAB XC Compilers are complete ANSI C compilers for all of Microchip's 8, 16 and 32-bit MCU and DSC devices. These compilers provide powerful integration capabilities, superior code optimization and ease of use. MPLAB XC Compilers run on Windows, Linux or MAC OS X.

For easy source level debugging, the compilers provide debug information that is optimized to the MPLAB X IDE.

The free MPLAB XC Compiler editions support all devices and commands, with no time or memory restrictions, and offer sufficient code optimization for most applications.

MPLAB XC Compilers include an assembler, linker and utilities. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. MPLAB XC Compiler uses the assembler to produce its object file. Notable features of the assembler include:

• Support for the entire device instruction set
• Support for fixed-point and floating-point data
• Command-line interface
• Rich directive set
• Flexible macro language
• MPLAB X IDE compatibility

## 26.3 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code, and COFF files for debugging.

The MPASM Assembler features include:

• Integration into MPLAB X IDE projects
• User-defined macros to streamline assembly code
• Conditional assembly for multipurpose source files
• Directives that allow complete control over the assembly process

## 26.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

• Efficient linking of single libraries instead of many smaller files
• Enhanced code maintainability by grouping related modules together
• Flexible creation of libraries with easy module listing, replacement, deletion and extraction

## 26.5 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC DSC devices. MPLAB XC Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

• Support for the entire device instruction set
• Support for fixed-point and floating-point data
• Command-line interface
• Rich directive set
• Flexible macro language
• MPLAB X IDE compatibility

## 26.6 MPLAB X SIM Software Simulator

The MPLAB X SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB X SIM Software Simulator fully supports symbolic debugging using the MPLAB XC Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

## 26.7 MPLAB REAL ICE In-Circuit Emulator System

The MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs all 8, 16 and 32-bit MCU, and DSC devices with the easy-to-use, powerful graphical user interface of the MPLAB X IDE.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ-11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB X IDE. MPLAB REAL ICE offers significant advantages over competitive emulators including full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, logic probes, a ruggedized probe interface and long (up to three meters) interconnection cables.

## 26.8 MPLAB ICD 3 In-Circuit Debugger System

The MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost-effective, high-speed hardware debugger/programmer for Microchip Flash DSC and MCU devices. It debugs and programs PIC Flash microcontrollers and dsPIC DSCs with the powerful, yet easy-to-use graphical user interface of the MPLAB IDE.

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

## 26.9 PICkit 3 In-Circuit Debugger/ Programmer

The MPLAB PICkit 3 allows debugging and programming of PIC and dsPIC Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB IDE. The MPLAB PICkit 3 is connected to the design engineer's PC using a full-speed USB interface and can be connected to the target via a Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the Reset line to implement in-circuit debugging and In-Circuit Serial Programming™ (ICSP™).

## 26.10 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at $V_{DDMIN}$ and $V_{DDMAX}$ for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages, and a modular, detachable socket assembly to support various package types. The ICSP cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices, and incorporates an MMC card for file storage and data applications.

## 26.11 Demonstration/Development Boards, Evaluation Kits and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ® security ICs, CAN, IrDA®, PowerSmart battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page (www.microchip.com) for the complete list of demonstration, development and evaluation kits.

## 26.12 Third-Party Development Tools

Microchip also offers a great collection of tools from third-party vendors. These tools are carefully selected to offer good value and unique functionality.

- Device Programmers and Gang Programmers from companies, such as SoftLog and CCS
- Software Tools from companies, such as Gimpel and Trace Systems
- Protocol Analyzers from companies, such as Saleae and Total Phase
- Demonstration Boards from companies, such as MikroElektronika, Digilent® and Olimex
- Embedded Ethernet Solutions from companies, such as EZ Web Lynx, WIZnet and IPLogika®

## 27.0   ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC24FV16KM204 family electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the PIC24FV16KM204 family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these, or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

### Absolute Maximum Ratings[†]

Ambient temperature under bias.................................................................................................................-40°C to +125°C

Storage temperature ...................................................................................................................... -65°C to +150°C

Voltage on $V_{DD}$ with respect to $V_{SS}$ (PIC24FXXKMXXX) ......................................................... -0.3V to +4.5V

Voltage on $V_{DD}$ with respect to $V_{SS}$ (PIC24FVXXKMXXX) ...................................................... -0.3V to +6.5V

Voltage on any combined analog and digital pin with respect to $V_{SS}$ ........................................... -0.3V to ($V_{DD}$ + 0.3V)

Voltage on any digital only pin with respect to $V_{SS}$ ...................................................... -0.3V to ($V_{DD}$ + 0.3V)

Voltage on $\overline{MCLR}$/$V_{PP}$ pin with respect to $V_{SS}$ ........................................................ -0.3V to +9.0V

Maximum current out of $V_{SS}$ pin .............................................................................................................300 mA

Maximum current into $V_{DD}$ pin[1].............................................................................................................250 mA

Maximum output current sunk by any I/O pin...............................................................................................25 mA

Maximum output current sourced by any I/O pin ...................................................................................25 mA

Maximum current sunk by all ports ..............................................................................................................200 mA

Maximum current sourced by all ports[1].............................................................................................200 mA

**Note 1:**   Maximum allowable current is a function of device maximum power dissipation (see Table 27-1).

> **†**   **Notice:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

## 27.1    DC Characteristics

**FIGURE 27-1:    PIC24FV16KM204 FAMILY VOLTAGE-FREQUENCY GRAPH (INDUSTRIAL)**

**Note:**    For frequencies between 8 MHz and 32 MHz, $F_{MAX}$ = 20 MHz * ($V_{DD}$ – 2.0) + 8 MHz.
**FIGURE 27-2:    PIC24F16KM204 FAMILY VOLTAGE-FREQUENCY GRAPH (INDUSTRIAL)**

**Note:**    For frequencies between 8 MHz and 32 MHz, $F_{MAX}$ = 20 MHz * ($V_{DD}$ – 1.8) + 8 MHz.
**FIGURE 27-3:** **PIC24FV16KM204 FAMILY VOLTAGE-FREQUENCY GRAPH (EXTENDED)**

**Note:** For frequencies between 8 MHz and 24 MHz, $F_{MAX}$ = 13.33 MHz * ($V_{DD}$ – 2.0) + 8 MHz.
**FIGURE 27-4:** **PIC24F16KM204 FAMILY VOLTAGE-FREQUENCY GRAPH (EXTENDED)**

**Note:** For frequencies between 8 MHz and 24 MHz, $F_{MAX}$ = 13.33 MHz * ($V_{DD}$ – 1.8) + 8 MHz.
### TABLE 27-1: THERMAL OPERATING CONDITIONS

| Rating | Symbol | Min | Typ | Max | Unit |
|---|---|---|---|---|---|
| Operating Junction Temperature Range | TJ | -40 | — | +140 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +125 | °C |
| Power Dissipation<br>  Internal Chip Power Dissipation:<br>    $P_{INT} = V_{DD} \times (I_{DD} - \Sigma\ I_{OH})$<br>  I/O Pin Power Dissipation:<br>    $P_{I/O} = \Sigma\ (\{V_{DD} - V_{OH}\} \times I_{OH}) + \Sigma\ (V_{OL} \times I_{OL})$ | PD | $P_{INT} + P_{I/O}$ | | | W |
| Maximum Allowed Power Dissipation | PDMAX | $(T_J - T_A)/\theta_{JA}$ | | | W |

### TABLE 27-2: THERMAL PACKAGING CHARACTERISTICS

| Characteristic | Symbol | Typ | Max | Unit | Notes |
|---|---|---|---|---|---|
| Package Thermal Resistance, 20-Pin PDIP | θJA | 62.4 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin SPDIP | θJA | 60 | — | °C/W | 1 |
| Package Thermal Resistance, 20-Pin SSOP | θJA | 108 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin SSOP | θJA | 71 | — | °C/W | 1 |
| Package Thermal Resistance, 20-Pin SOIC | θJA | 75 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin SOIC | θJA | 80.2 | — | °C/W | 1 |
| Package Thermal Resistance, 20-Pin QFN | θJA | 43 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin QFN | θJA | 32 | — | °C/W | 1 |
| Package Thermal Resistance, 44-Pin QFN | θJA | 29 | — | °C/W | 1 |
| Package Thermal Resistance, 44-Pin TQFP | θJA | 40 | — | °C/W | 1 |
| Package Thermal Resistance, 48-Pin UQFN | θJA | 41 | — | °C/W | 1 |

**Note 1:** Junction to ambient thermal resistance, Theta-JA ($\theta_{JA}$) numbers are achieved by package simulations.

### TABLE 27-3: DC CHARACTERISTICS: TEMPERATURE AND VOLTAGE SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KMXXX)<br>2.0V to 5.5V (PIC24FV16KMXXX) | | | | |
|---|---|---|---|---|---|---|---|
| | | | Operating temperature | -40°C ≤ TA ≤ +85°C for Industrial<br>-40°C ≤ TA ≤ +125°C for Extended | | | |
| Param No. | Symbol | Characteristic | Min | Typ[1] | Max | Units | Conditions |
| DC10 | VDD | **Supply Voltage** | 1.8 | — | 3.6 | V | For PIC24F devices |
| | | | 2.0 | — | 5.5 | V | For PIC24FV devices |
| DC12 | VDR | **RAM Data Retention Voltage**[2] | 1.6 | — | — | V | For PIC24F devices |
| | | | 1.8 | — | — | V | For PIC24FV devices |
| DC16 | VPOR | **VDD Start Voltage** to Ensure Internal Power-on Reset Signal | VSS | — | 0.7 | V | |
| DC17 | SVDD | **VDD Rise Rate** to Ensure Internal Power-on Reset Signal | 0.05 | — | — | V/ms | 0-3.3V in 0.1s<br>0-2.5V in 60 ms |

**Note 1:** Data in "Typ" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

**2:** This is the limit to which VDD can be lowered without losing RAM data.

**TABLE 27-4: HIGH/LOW-VOLTAGE DETECT CHARACTERISTICS**

| Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KM204) | | | | | | | |
|---|---|---|---|---|---|---|---|
| | | 2.0V to 5.5V (PIC24FV16KM204) | | | | | |
| Operating temperature | | -40°C ≤ TA ≤ +85°C for Industrial | | | | | |
| | | -40°C ≤ TA ≤ +125°C for Extended | | | | | |

| Param No. | Symbol | Characteristic | | Min | Typ | Max | Units | Conditions |
|---|---|---|---|---|---|---|---|---|
| DC18 | V$_{HLVD}$ | HLVD Voltage on V$_{DD}$ Transition | HLVDL<3:0> = 0000[2] | — | — | 1.90 | V | |
| | | | HLVDL<3:0> = 0001 | 1.88 | — | 2.13 | V | |
| | | | HLVDL<3:0> = 0010 | 2.09 | — | 2.35 | V | |
| | | | HLVDL<3:0> = 0011 | 2.25 | — | 2.53 | V | |
| | | | HLVDL<3:0> = 0100 | 2.35 | — | 2.62 | V | |
| | | | HLVDL<3:0> = 0101 | 2.55 | — | 2.84 | V | |
| | | | HLVDL<3:0> = 0110 | 2.80 | — | 3.10 | V | |
| | | | HLVDL<3:0> = 0111 | 2.95 | — | 3.25 | V | |
| | | | HLVDL<3:0> = 1000 | 3.09 | — | 3.41 | V | |
| | | | HLVDL<3:0> = 1001 | 3.27 | — | 3.59 | V | |
| | | | HLVDL<3:0> = 1010[1] | 3.46 | — | 3.79 | V | |
| | | | HLVDL<3:0> = 1011[1] | 3.62 | — | 4.01 | V | |
| | | | HLVDL<3:0> = 1100[1] | 3.91 | — | 4.26 | V | |
| | | | HLVDL<3:0> = 1101[1] | 4.18 | — | 4.55 | V | |
| | | | HLVDL<3:0> = 1110[1] | 4.49 | — | 4.87 | V | |

**Note 1:** These trip points should not be used on PIC24FXXKMXXX devices.

**2:** This trip point should not be used on PIC24FVXXKMXXX devices.

**TABLE 27-5: BOR TRIP POINTS**

| Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KM204) | | | | | | | |
|---|---|---|---|---|---|---|---|
| | | 2.0V to 5.5V (PIC24FV16KM204) | | | | | |
| Operating temperature | | -40°C ≤ TA ≤ +85°C for Industrial | | | | | |
| | | -40°C ≤ TA ≤ +125°C for Extended | | | | | |

| Param No. | Sym | Characteristic | | Min | Typ | Max | Units | Conditions |
|---|---|---|---|---|---|---|---|---|
| DC15 | | BOR Hysteresis | | — | 5 | — | mV | |
| DC19 | | BOR Voltage on V$_{DD}$ Transition | BORV<1:0> = 00 | — | — | — | — | Valid for LPBOR (**Note 1**) |
| | | | BORV<1:0> = 01 | 2.90 | 3 | 3.38 | V | |
| | | | BORV<1:0> = 10 | 2.53 | 2.7 | 3.07 | V | |
| | | | BORV<1:0> = 11 | 1.75 | 1.85 | 2.05 | V | (**Note 2**) |
| | | | BORV<1:0> = 11 | 1.95 | 2.05 | 2.16 | V | (**Note 3**) |

**Note 1:** LPBOR re-arms the POR circuit but does not cause a BOR.

**2:** This is valid for PIC24F (3.3V) devices.

**3:** This is valid for PIC24FV (5V) devices.

| DI20 | | I/O Pins:<br>    with Analog Functions<br>    Digital Only | 0.8 VDD<br>0.8 VDD | —<br>— | VDD<br>VDD | V<br>V | |
| DI25 | | $\overline{MCLR}$ | 0.8 VDD | — | VDD | V | |
| DI26 | | OSCI (XT mode) | 0.7 VDD | — | VDD | V | |
| DI27 | | OSCI (HS mode) | 0.7 VDD | — | VDD | V | |
| DI28 | | I/O Pins with I²C Buffer:<br>    with Analog Functions<br>    Digital Only | 0.7 VDD<br>0.7 VDD | —<br>— | VDD<br>VDD | V<br>V | |
| DI29 | | I/O Pins with SMBus | 2.1 | — | VDD | V | 2.5V ≤ VPIN ≤ VDD |
| DI30 | ICNPU | **CNx Pull-up Current** | 50 | 250 | 500 | µA | VDD = 3.3V, VPIN = Vss |
| DI31 | IPU | **Maximum Load Current for Digital High Detection w/Internal Pull-up** | — | — | 30 | µA | VDD = 2.0V |
| | | | — | — | 1000 | µA | VDD = 3.3V |
| | IIL | **Input Leakage Current**[2,3] | | | | | |
| DI50 | | I/O Ports | — | 0.050 | ±0.100 | µA | Vss ≤ VPIN ≤ VDD,<br>Pin at high-impedance |
| DI51 | | Pins with OAxOUT Functions (RB15 and RB3) | — | 0.100 | ±0.200 | µA | Vss ≤ VPIN ≤ VDD,<br>Pin at high-impedance |

**Note 1:** Data in "Typ" column is at 3.3V, +25°C unless otherwise stated.

**2:** The leakage current on the $\overline{MCLR}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

**3:** Negative current is defined as current sourced by the pin.

**4:** Refer to Table 1-4 and Table 1-5 for I/O pin buffer types.

**5:** VIH requirements are met when the internal pull-ups are enabled.

## TABLE 27-10: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

| DC CHARACTERISTICS | | | | | | | Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KM204) 2.0V to 5.5V (PIC24FV16KM204) Operating temperature  -40°C ≤ TA ≤ +85°C for Industrial  -40°C ≤ TA ≤ +125°C for Extended | |
|---|---|---|---|---|---|---|---|---|
| Param No. | Sym | Characteristic | Min | Typ[1] | Max | Units | Conditions | |
| | VOL | **Output Low Voltage** | | | | | | |
| DO10 | | All I/O Pins | — | — | 0.4 | V | IOL = 8.0 mA | VDD = 4.5V |
| | | | — | — | 0.4 | V | IOL = 4.0 mA | VDD = 3.6V |
| | | | — | — | 0.4 | V | IOL = 3.5 mA | VDD = 2.0V |
| DO16 | | OSC2/CLKO | — | — | 0.4 | V | IOL = 2.0 mA | VDD = 4.5V |
| | | | — | — | 0.4 | V | IOL = 1.2 mA | VDD = 3.6V |
| | | | — | — | 0.4 | V | IOL = 0.4 mA | VDD = 2.0V |
| | VOH | **Output High Voltage** | | | | | | |
| DO20 | | All I/O Pins | 3.8 | — | — | V | IOH = -3.5 mA | VDD = 4.5V |
| | | | 3 | — | — | V | IOH = -3.0 mA | VDD = 3.6V |
| | | | 1.6 | — | — | V | IOH = -1.0 mA | VDD = 2.0V |
| DO26 | | OSC2/CLKO | 3.8 | — | — | V | IOH = -2.0 mA | VDD = 4.5V |
| | | | 3 | — | — | V | IOH = -1.0 mA | VDD = 3.6V |
| | | | 1.6 | — | — | V | IOH = -0.5 mA | VDD = 2.0V |

**Note 1:** Data in "Typ" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

## TABLE 27-11: DC CHARACTERISTICS: PROGRAM MEMORY

| DC CHARACTERISTICS | | | | | | | Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KM204) 2.0V to 5.5V (PIC24FV16KM204) Operating temperature  -40°C ≤ TA ≤ +85°C for Industrial  -40°C ≤ TA ≤ +125°C for Extended |
|---|---|---|---|---|---|---|---|
| Param No. | Sym | Characteristic | Min | Typ[1] | Max | Units | Conditions |
| | | **Program Flash Memory** | | | | | |
| D130 | EP | Cell Endurance | 10,000[2] | — | — | E/W | |
| D131 | VPR | VDD for Read | VMIN | — | 3.6 | V | VMIN = Minimum operating voltage |
| D133A | TIW | Self-Timed Write Cycle Time | — | 2 | — | ms | |
| D134 | TRETD | Characteristic Retention | 40 | — | — | Year | Provided no other specifications are violated |
| D135 | IDDP | Supply Current During Programming | — | 10 | — | mA | |

**Note 1:** Data in "Typ" column is at 3.3V, +25°C unless otherwise stated.
    **2:** Self-write and block erase.

## TABLE 27-12: DC CHARACTERISTICS: DATA EEPROM MEMORY

|---|---|---|---|---|---|---|---|
| **Param No.** | **Symbol** | **Characteristics** | **Min** | **Typ** | **Max** | **Units** | **Comments** |
| | $V_{BG}$ | Band Gap Reference Voltage | 0.973 | 1.024 | 1.075 | V | $V_{DD}$ > 4.5V for 4*$V_{BG}$ reference<br>$V_{DD}$ > 2.3V for 2*$V_{BG}$ reference |
| | $T_{BG}$ | Band Gap Reference Start-up Time | — | 1 | — | ms | |
| | $V_{RGOUT}$ | Regulator Output Voltage | 3.1 | 3.3 | 3.6 | V | |
| | $C_{EFC}$ | External Filter Capacitor Value | 4.7 | 10 | — | µF | Series resistance < 3 Ohm recommended;<br>< 5 Ohm is required. |
| | $V_{LVR}$ | Low-Voltage Regulator Output Voltage | — | 2.6 | — | V | |

### TABLE 27-16: CTMU CURRENT SOURCE SPECIFICATIONS

| **DC CHARACTERISTICS** | | | **Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KM204)**<br>**2.0V to 5.5V (PIC24FV16KM204)**<br>Operating temperature ⠀⠀-40°C ≤ TA ≤ +85°C for Industrial<br>⠀⠀-40°C ≤ TA ≤ +125°C for Extended | | | | | |
|---|---|---|---|---|---|---|---|---|
| **Param No.** | **Sym** | **Characteristic** | **Min** | **Typ**[1] | **Max** | **Units** | **Comments** | **Conditions** |
| | $I_{OUT1}$ | CTMU Current Source, Base Range | — | 550 | — | nA | CTMUCON1L<1:0> = `01` | |
| | $I_{OUT2}$ | CTMU Current Source, 10x Range | — | 5.5 | — | µA | CTMUCON1L<1:0> = `10` | |
| | $I_{OUT3}$ | CTMU Current Source, 100x Range | — | 55 | — | µA | CTMUCON1L<1:0> = `11` | 2.5V < $V_{DD}$ < $V_{DDMAX}$ |
| | $I_{OUT4}$ | CTMU Current Source, 1000x Range | — | 550 | — | µA | CTMUCON1L<1:0> = `00`<br>**(Note 2)** | |
| | $V_F$ | Temperature Diode Forward Voltage | — | .76 | — | V | | |
| | $V\Delta$ | Voltage Change per Degree Celsius | — | 1.6 | — | mV/°C | | |

**Note 1:** Nominal value at the center point of the current trim range (CTMUCON1L<7:2> = `000000`). On PIC24F16KM parts, the current output is limited to the typical current value when $I_{OUT4}$ is chosen.

⠀⠀**2:** Do not use this current range with a temperature sensing diode.

### TABLE 27-17: OPERATIONAL AMPLIFIER SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KM204)<br>2.0V to 5.5V (PIC24FV16KM204)<br>Operating temperature    -40°C ≤ TA ≤ +85°C for Industrial<br>-40°C ≤ TA ≤ +125°C for Extended | | | | |
|---|---|---|---|---|---|---|---|
| Param No. | Sym | Characteristic | Min | Typ[1] | Max | Units | Comments |
| | GBWP | Gain Bandwidth Product | — | 5 | — | MHz | SPDSEL = 1 |
| | | | — | 0.5 | — | MHz | SPDSEL = 0 |
| | SR | Slew Rate | — | 1.2 | — | V/µs | SPDSEL = 1 |
| | | | — | 0.3 | — | V/µs | SPDSEL = 0 |
| | $A_{OL}$ | DC Open-Loop Gain | — | 90 | — | dB | |
| | $V_{IOFF}$ | Input Offset Voltage | — | ±2 | ±10 | mV | |
| | $V_{IBC}$ | Input Bias Current | — | — | — | nA | (Note 1) |
| | $V_{ICM}$ | Common-Mode Input Voltage Range | $AV_{SS}$ | — | $AV_{DD}$ | V | |
| | CMRR | Common-Mode Rejection Ratio | — | 60 | — | db | |
| | PSRR | Power Supply Rejection Ratio | — | 60 | — | dB | |
| | $V_{OR}$ | Output Voltage Range | $AV_{SS}$ + 200 | $AV_{SS}$ + 5 to $AV_{DD}$ – 5 | $AV_{DD}$ – 200 | mV | 0.5V input overdrive, no output loading |

**Note 1:** The op amps use CMOS input circuitry with negligible input bias current. The maximum "effective bias current" is the I/O pin leakage specified by electrical Parameter DI50.

## 27.2 AC Characteristics and Timing Parameters

The information contained in this section defines the PIC24FV16KM204 family AC characteristics and timing parameters.

**TABLE 27-18: TEMPERATURE AND VOLTAGE SPECIFICATIONS – AC**

| AC CHARACTERISTICS | **Standard Operating Conditions: 1.8V to 3.6V** |
|---|---|
| | Operating temperature          -40°C ≤ TA ≤ +85°C for Industrial |
| | -40°C ≤ TA ≤ +125°C for Extended |
| | Operating voltage VDD range as described in **Section 27.1 "DC Characteristics"**. |

**FIGURE 27-5: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS**

RL = 464Ω
CL = 50 pF for all pins except OSCO
15 pF for OSCO output
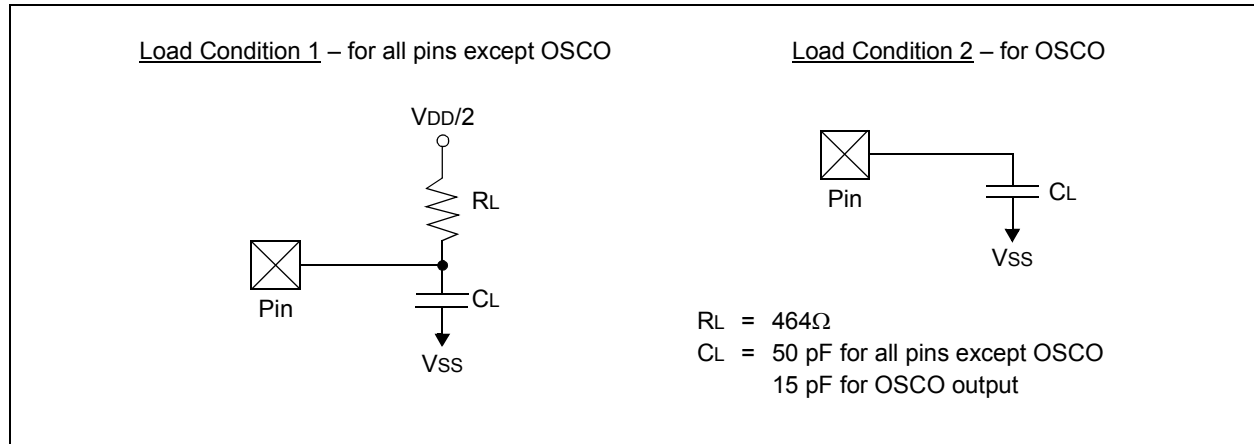

**TABLE 27-19: CAPACITIVE LOADING REQUIREMENTS ON OUTPUT PINS**

| Param No. | Symbol | Characteristic | Min | Typ[1] | Max | Units | Conditions |
|---|---|---|---|---|---|---|---|
| DO50 | COSC2 | OSCO/CLKO Pin | — | — | 15 | pF | In XT and HS modes when External Clock is used to drive OSCI |
| DO56 | CIO | All I/O Pins and OSCO | — | — | 50 | pF | EC mode |
| DO58 | CB | SCLx, SDAx | — | — | 400 | pF | In I²C™ mode |

**Note 1:** Data in "Typ" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

**FIGURE 27-6:** **EXTERNAL CLOCK TIMING**

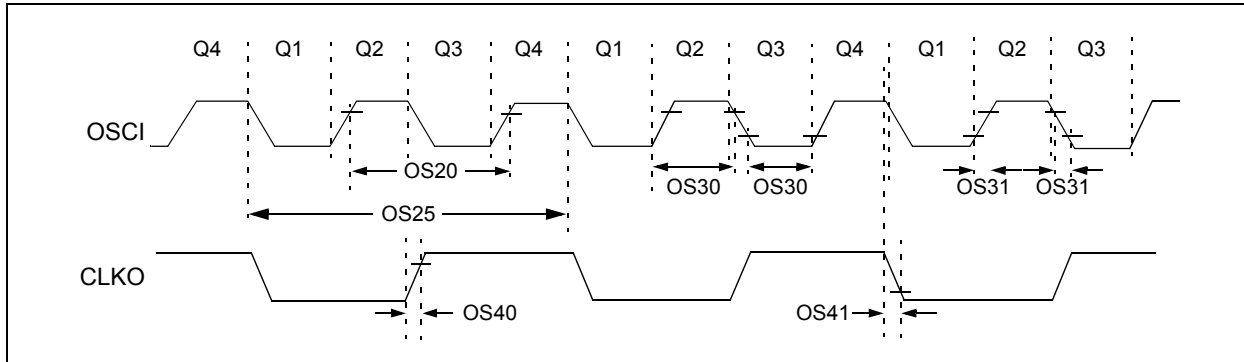

**TABLE 27-20: EXTERNAL CLOCK TIMING REQUIREMENTS**

| AC CHARACTERISTICS | | | Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KM204) 2.0V to 5.5V (PIC24FV16KM204) | | | | |
|---|---|---|---|---|---|---|---|
| | | | Operating temperature | | -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | |
| Param No. | Sym | Characteristic | Min | Typ[1] | Max | Units | Conditions |
| OS10 | FOSC | External CLKI Frequency (External Clocks allowed only in EC mode) | DC 4 DC 4 | — — — — | 32 8 24 6 | MHz MHz MHz MHz | EC, -40°C < TA < +85°C ECPLL, -40°C < TA < +85°C EC, -40°C < TA < +125°C ECPLL, -40°C < TA < +125°C |
| | | Oscillator Frequency | 0.2 4 4 4 31 | — — — — — | 4 25 8 6 33 | MHz MHz MHz MHz kHz | XT HS XTPLL, -40°C < TA < +85°C XTPLL, -40°C < TA < +125°C SOSC |
| OS20 | TOSC | TOSC = 1/FOSC | — | — | — | — | See Parameter OS10 for FOSC value |
| OS25 | TCY | Instruction Cycle Time[2] | 62.5 | — | DC | ns | |
| OS30 | TosL, TosH | External Clock in (OSCI) High or Low Time | 0.45 x TOSC | — | — | ns | EC |
| OS31 | TosR, TosF | External Clock in (OSCI) Rise or Fall Time | — | — | 20 | ns | EC |
| OS40 | TckR | CLKO Rise Time[3] | — | 6 | 10 | ns | |
| OS41 | TckF | CLKO Fall Time[3] | — | 6 | 10 | ns | |

**Note 1:** Data in "Typ" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

**2:** Instruction cycle period (TCY) equals two times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type, under standard operating conditions, with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "Min." values with an External Clock applied to the OSCI/CLKI pin. When an External Clock input is used, the "Max." cycle time limit is "DC" (no clock) for all devices.

**3:** Measurements are taken in EC mode. The CLKO signal is measured on the OSCO pin. CLKO is low for the Q1-Q2 period (1/2 TCY) and high for the Q3-Q4 period (1/2 TCY).

### TABLE 27-21: PLL CLOCK TIMING SPECIFICATIONS

| AC CHARACTERISTICS | | | Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KM204)<br>2.0V to 5.5V (PIC24FV16KM204) | | | | |
| --- | --- | --- | --- | --- | --- | --- | --- |
| | | | Operating temperature | -40°C ≤ TA ≤ +85°C for Industrial<br>-40°C ≤ TA ≤ +125°C for Extended | | | |
| Param No. | Sym | Characteristic[1] | Min | Typ[2] | Max | Units | Conditions |
| OS50 | FPLLI | PLL Input Frequency Range | 4 | — | 8 | MHz | ECPLL, HSPLL modes,<br>-40°C ≤ TA ≤ +85°C |
| OS51 | FSYS | PLL Output Frequency Range | 16 | — | 32 | MHz | -40°C ≤ TA ≤ +85°C |
| OS52 | TLOCK | PLL Start-up Time (Lock Time) | — | 1 | 2 | ms | |
| OS53 | DCLK | CLKO Stability (Jitter) | -2 | 1 | 2 | % | Measured over 100 ms period |

**Note 1:** These parameters are characterized but not tested in manufacturing.

**2:** Data in "Typ" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

### TABLE 27-22: INTERNAL RC OSCILLATOR ACCURACY

| AC CHARACTERISTICS | | | Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KM204)<br>2.0V to 5.5V (PIC24FV16KM204) | | | | |
| --- | --- | --- | --- | --- | --- | --- | --- |
| | | | Operating temperature | -40°C ≤ TA ≤ +85°C for Industrial<br>-40°C ≤ TA ≤ +125°C for Extended | | | |
| Param No. | Characteristic | Min | Typ | Max | Units | Conditions | |
| F20 | FRC @ 8 MHz[1] | -2 | — | +2 | % | +25°C | 3.0V ≤ VDD ≤ 3.6V, F device<br>3.2V ≤ VDD ≤ 5.5V, FV device |
| | | -5 | — | +5 | % | -40°C ≤ TA ≤ +125°C | 1.8V ≤ VDD ≤ 3.6V, F device<br>2.0V ≤ VDD ≤ 5.5V, FV device |
| F21 | LPRC @ 31 kHz[2] | -15 | — | +15 | % | -40°C ≤ TA ≤ +125°C | 1.8V ≤ VDD ≤ 3.6V, F device<br>2.0V ≤ VDD ≤ 5.5V, FV device |

**Note 1:** The frequency is calibrated at +25°C and 3.3V. The OSCTUN bits can be used to compensate for temperature drift.

**2:** The change of LPRC frequency as VDD changes.

**TABLE 27-34: I²C™ BUS DATA REQUIREMENTS (SLAVE MODE)**

| Param. No. | Symbol | Characteristic | | Min | Max | Units | Conditions |
|---|---|---|---|---|---|---|---|
| 100 | T$_{HIGH}$ | Clock High Time | 100 kHz mode | 4.0 | — | μs | Must operate at a minimum of 1.5 MHz |
| | | | 400 kHz mode | 0.6 | — | μs | Must operate at a minimum of 10 MHz |
| | | | MSSPx module | 1.5 T$_{CY}$ | — | — | |
| 101 | T$_{LOW}$ | Clock Low Time | 100 kHz mode | 4.7 | — | μs | Must operate at a minimum of 1.5 MHz |
| | | | 400 kHz mode | 1.3 | — | μs | Must operate at a minimum of 10 MHz |
| | | | MSSPx module | 1.5 T$_{CY}$ | — | — | |
| 102 | T$_R$ | SDAx and SCLx Rise Time | 100 kHz mode | — | 1000 | ns | |
| | | | 400 kHz mode | 20 + 0.1 C$_B$ | 300 | ns | C$_B$ is specified to be from 10 to 400 pF |
| 103 | T$_F$ | SDAx and SCLx Fall Time | 100 kHz mode | — | 300 | ns | |
| | | | 400 kHz mode | 20 + 0.1 C$_B$ | 300 | ns | C$_B$ is specified to be from 10 to 400 pF |
| 90 | T$_{SU:STA}$ | Start Condition Setup Time | 100 kHz mode | 4.7 | — | μs | Only relevant for Repeated Start condition |
| | | | 400 kHz mode | 0.6 | — | μs | |
| 91 | T$_{HD:STA}$ | Start Condition Hold Time | 100 kHz mode | 4.0 | — | μs | After this period, the first clock pulse is generated |
| | | | 400 kHz mode | 0.6 | — | μs | |
| 106 | T$_{HD:DAT}$ | Data Input Hold Time | 100 kHz mode | 0 | — | ns | |
| | | | 400 kHz mode | 0 | 0.9 | μs | |
| 107 | T$_{SU:DAT}$ | Data Input Setup Time | 100 kHz mode | 250 | — | ns | **(Note 2)** |
| | | | 400 kHz mode | 100 | — | ns | |
| 92 | T$_{SU:STO}$ | Stop Condition Setup Time | 100 kHz mode | 4.7 | — | μs | |
| | | | 400 kHz mode | 0.6 | — | μs | |
| 109 | T$_{AA}$ | Output Valid from Clock | 100 kHz mode | — | 3500 | ns | **(Note 1)** |
| | | | 400 kHz mode | — | — | ns | |
| 110 | T$_{BUF}$ | Bus Free Time | 100 kHz mode | 4.7 | — | μs | Time the bus must be free before a new transmission can start |
| | | | 400 kHz mode | 1.3 | — | μs | |
| D102 | C$_B$ | Bus Capacitive Loading | | — | 400 | pF | |

**Note 1:** As a transmitter, the device must provide this internal minimum delay time to bridge the undefined region (min. 300 ns) of the falling edge of SCLx to avoid unintended generation of Start or Stop conditions.

**2:** A Fast mode I²C™ bus device can be used in a Standard mode I²C bus system, but the requirement, T$_{SU:DAT}$ ≥ 250 ns, must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCLx signal. If such a device does stretch the LOW period of the SCLx signal, it must output the next data bit to the SDAx line, T$_R$ max. + T$_{SU:DAT}$ = 1000 + 250 = 1250 ns (according to the Standard mode I²C bus specification), before the SCLx line is released.

**FIGURE 27-17: MSSPx I²C™ BUS START/STOP BITS TIMING WAVEFORMS**

Note: Refer to Figure 27-5 for load conditions.
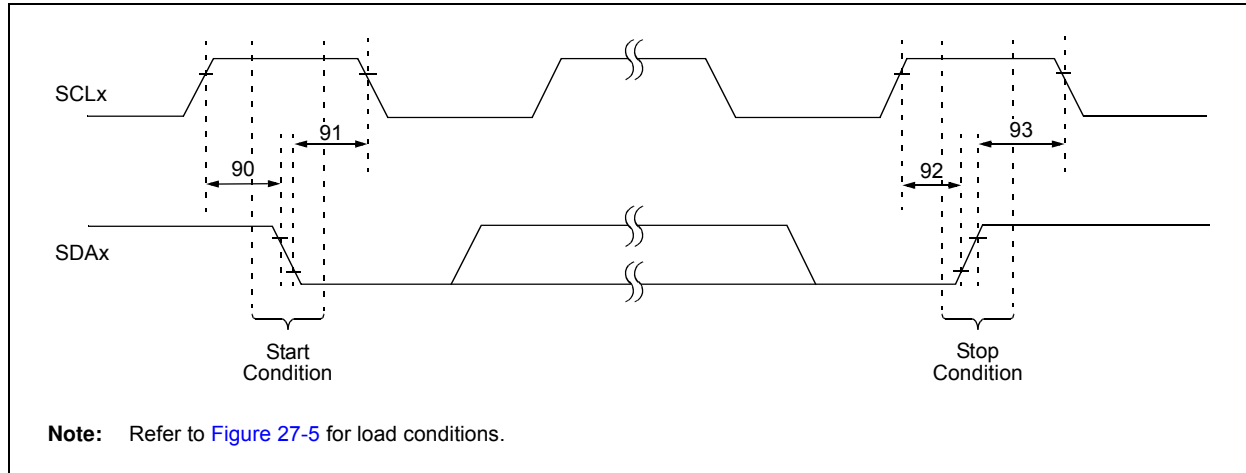

**TABLE 27-35: I²C™ BUS START/STOP BITS REQUIREMENTS (MASTER MODE)**

| Param. No. | Symbol | Characteristic | | Min | Max | Units | Conditions |

| | | | 400 kHz mode | 2($T_{OSC}$)(BRG + 1) | — | — | |
| 102 | $T_R$ | SDAx and SCLx Rise Time | 100 kHz mode | — | 1000 | ns | $C_B$ is specified to be from 10 to 400 pF |
| | | | 400 kHz mode | 20 + 0.1 $C_B$ | 300 | ns | |
| 103 | $T_F$ | SDAx and SCLx Fall Time | 100 kHz mode | — | 300 | ns | $C_B$ is specified to be from 10 to 400 pF |
| | | | 400 kHz mode | 20 + 0.1 $C_B$ | 300 | ns | |
| 90 | $T_{SU:STA}$ | Start Condition Setup Time | 100 kHz mode | 2($T_{OSC}$)(BRG + 1) | — | — | Only relevant for Repeated Start condition |
| | | | 400 kHz mode | 2($T_{OSC}$)(BRG + 1) | — | — | |
| 91 | $T_{HD:STA}$ | Start Condition Hold Time | 100 kHz mode | 2($T_{OSC}$)(BRG + 1) | — | — | After this period, the first clock pulse is generated |
| | | | 400 kHz mode | 2($T_{OSC}$)(BRG + 1) | — | — | |
| 106 | $T_{HD:DAT}$ | Data Input Hold Time | 100 kHz mode | 0 | — | ns | |
| | | | 400 kHz mode | 0 | 0.9 | μs | |
| 107 | $T_{SU:DAT}$ | Data Input Setup Time | 100 kHz mode | 250 | — | ns | **(Note 1)** |
| | | | 400 kHz mode | 100 | — | ns | |
| 92 | $T_{SU:STO}$ | Stop Condition Setup Time | 100 kHz mode | 2($T_{OSC}$)(BRG + 1) | — | — | |
| | | | 400 kHz mode | 2($T_{OSC}$)(BRG + 1) | — | — | |
| 109 | $T_{AA}$ | Output Valid from Clock | 100 kHz mode | — | 3500 | ns | |
| | | | 400 kHz mode | — | 1000 | ns | |
| 110 | $T_{BUF}$ | Bus Free Time | 100 kHz mode | 4.7 | — | μs | Time the bus must be free before a new transmission can start |
| | | | 400 kHz mode | 1.3 | — | μs | |
| D102 | $C_B$ | Bus Capacitive Loading | | — | 400 | pF | |

Note 1: A Fast mode I²C bus device can be used in a Standard mode I²C bus system, but Parameter 107 ≥ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCLx signal. If such a device does stretch the LOW period of the SCLx signal, it must output the next data bit to the SDAx line, Parameter 102 + Parameter 107 = 1000 + 250 = 1250 ns (for 100 kHz mode), before the SCLx line is released.

| AD25b | | Monotonicity[1] | — | — | — | — | Guaranteed |

**Note 1:** The A/D conversion result never decreases with an increase in the input voltage.

**2:** Measurements are taken with external VREF+ and VREF- used as the A/D voltage reference.

© 2013 Microchip Technology Inc.

**FIGURE 27-19: A/D CONVERSION TIMING**

**Note 1:** If the A/D clock source is selected as RC, a time of $T_{CY}$ is added before the A/D clock starts. This allows the `SLEEP` instruction to be executed.

**2:** This is a minimal RC delay (typically 100 ns) which also disconnects the holding capacitor from the analog input.

**TABLE 27-38: A/D CONVERSION TIMING REQUIREMENTS[1]**

| | | | Standard Operating Conditions: 1.8V to 3.6 (PIC24F16KM204) 2.0V to 5.5V (PIC24FV16KM204) | | | | |
|---|---|---|---|---|---|---|---|

| Contact-to-Exposed Pad | K | 0.20 | - | - |

**Notes:**
1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Package is saw singulated.
3. Dimensioning and tolerancing per ASME Y14.5M.
   BSC: Basic Dimension. Theoretically exact value shown without tolerances.
   REF: Reference Dimension, usually without tolerance, for information purposes only.

**NOTES:**

## APPENDIX A: REVISION HISTORY

### Revision A (February 2013)

Original data sheet for the PIC24FV16KM204 family of devices.

### Revision B (July 2013)

Updates all references to PGCx and PGDx pin functions throughout the document to PGECx and PGEDx.

Updates **Section 4.0 "Memory Organization"** to change bit 12 in the following registers to reserved ("r" designation):

- CCP1CON1L (Table 4-8)
- CCP2CON1L (Table 4-9)
- CCP3CON1L (Table 4-10)
- CCP4CON1L (Table 4-11)
- CCP5CON1L (Table 4-12)

Updates **Section 13.0 "Capture/Compare/PWM/ Timer Modules (MCCP and SCCP)"**:

- Replaces bit 12 of CCPxCON1L (CCPSLP) and its description with a reserved bit
- Removes references to asynchronous operation in Sleep mode (and in other occurrences throughout the document)
- Modifies **Section 13.1 "Time Base Generator"** to add synchronous operation limitations; adds Table 13-1 to list valid clock options for all operating modes
- Removes the system clock as a time base input option
- Removes external input sources, comparators and CTMU as synchronization sources in Table 13-6; clarifies that other selected sources must be synchronous

Removes the input buffer from the band gap reference input in Figure 20-1.

Adds BUFCON0 register description (Register 20-2) to **Section 20.0 "8-Bit Digital-to-Analog Converter (DAC)"**.

Changes references to internal band gap voltages ($V_{BG}$, $V_{BG}/2$ and BGBUF0) in **Section 20.0 "8-Bit Digital-to-Analog Converter (DAC)"** and **Section 22.0 "Comparator Module"** to BGBUF1.

Adds minimum $V_{DD}$ conditions for $V_{BG}$ specification in Table 27-15 (Internal Voltage Regulator Specifications).

Other minor typographical corrections throughout the document.

**NOTES:**

## INDEX

# PIC24FV16KM204 FAMILY

**NOTES:**

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the web site at: http://microchip.com/support**

**NOTES:**

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

**NOTES:**

© 2013 Microchip Technology Inc.

**Note the following details of the code protection feature on Microchip devices:**

• Microchip products meet the specification contained in their particular Microchip Data Sheet.

• Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.

• There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.

• Microchip is willing to work with the customer who is concerned about the integrity of their code.

• Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM**

**CERTIFIED BY DNV**

**═ ISO/TS 16949 ═**

**Trademarks**

*Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
